# The 119th Year of Thombours Seath of Se

ESTABLISHED 1802

1920

J.M.Thorburn & Co.

53 BARCLAY STREET THROUGH TO 54 PARK PLACE

New York City

ON'T be a slave to the uncertainty of supply and the high prices of "shippedin" vegetables this spring. Your own back

yard is a veritable gold mine while these essential fresh foods are selling at record-breaking prices. Let us help you have healthbuilding vegetables of full flavored freshness this season—at a fraction of the shopkeeper's prices.

We want you to know THORBURN SEEDS—to test the healthful pleasure and economy of cultivating your own vegetables. That's why we're making this "Get Acquainted" offer of one of our famous COLLECTIONS of VEGETABLE SEEDS for small Gardens.

# Collection

\$1.50 (INCLUDING FREE DELIVERY IN U. S.)

- 1 pkt. Beans, Refugee Green-Pod.
- 1 pkt. Beans, Golden Wax.
- 1 pkt. Beet, Egyptian.
- 1 pkt. Cabbage, Early Wakefield.
- 1 pkt. Carrot, Half-Long.
- ½lb. Corn, Early Bantam.
- r pkt. Cucumber, Improved
- White Spine.
- r pkt. Kohlrabi.

- 1 pkt. Leek, Best Flag.
- I pkt. Lettuce, Big Boston.
- I pkt. Onion, White Globe.
- 1 pkt. Parsley, Extra Curled.
- 1/2lb. Peas, Thorburn's Extra-Early Market.
- 1 pkt. Radish, Scarlet Turnip.
- 1 pkt. Spinach, Viroflay.
- 1 pkt. Turnip, Snowball.

# **Victory Collection**

\$1.00 (INCLUDING FREE DELIVERY IN U. S.)

One packet each.

Green Beans. Wax Beans.

Beets.

Carrot.

Parsley.

Spinach. Turnip.

Lettuce. Onion.

Peas. Radish.

Swiss Chard.

Golden Bantam Corn.

THORBURN SEEDS are the pick of the World's best-seeds that combine hardiness, fertility and vigor that assure best results—that produce the biggest, firmest, crispest, best-flavored vegetables.

For other Collections for larger Gardens, ranging from \$4 to \$36, see pages 4 and 5 of this Catalogue

# 1802-1920

# 119TH ANNUAL SEED CATALOGUE OF J. M. THORBURN & COMPANY

ECAUSE a business seldom lives long unless it obtains and retains the good-will of its patrons, age and continuous successful commerce are of more significance than the mere passing of years. High ideals are essential to long life and continued good reputation, particularly in the seed business, in which so much depends not only upon ideals but upon their diligent pursuit in the matters of reliability, purity, and good service.

That we have kept both the quality of our merchandise and of our dealing in the front rank during nearly four generations in the life of men is

indicative both of our high aims and of the value of cumulative experience.

Thus, in the beginning of the 119th year of our continuous existence as seedsmen, the Thorburn name stands not only for experience and knowledge in seed-growing, but for that fair dealing which makes transactions with us both safe and pleasant. Retaining our old customers on the basis of our service, we seek new friends also upon the same and single basis of "a square deal" as to reliability in merchandise and in methods.

It has always been our effort to make this catalogue truly representative and helpful. The descriptions are carefully revised and kept completely accurate, and the concise cultural directions are intended to guide the planter to success. Additional information, impracticable to present here without unduly increasing the bulk of the catalogue, is available from our long and extensive experience and will be cheerfully supplied upon request. We are now preparing

# **Convenient Leaflets Upon the Culture**

of each vegetable, which will be furnished to our customers for the asking, at any time.

In these times of disturbed and congested transportation, and in connection with the shortage of many seed crops in America and abroad, it is an advantage, both to the seedsman and the planter to have early orders. If, therefore, our friends will make known their wants promptly upon receipt of this catalogue, we can with more certainty make shipment at the proper time. Planting at the most favorable season for successful results may thus be assured. Always, however, we meet the wishes of our customers to the best of our ability, whatever be the time of ordering. Likewise, in the midst of the existing price-soaring conditions, we keep our prices at the lowest point consistent with the exceptional quality we maintain and the necessary cost of handling.

In addition to asking our friends to read carefully the next page preparatory to making up their orders, we call attention to the fact that our seed supplies come from many parts of the world and that sometimes it seems best to send out such portions of orders as may be at the moment available, forwarding the remainder later upon receipt. Please, therefore, await our advice or the invoice before writing us about items not received.

Orders. Orders should be written on our order sheet or on a blank sheet separate from letter, preferably in ink, and, to receive prompt attention, should be directed to the firm and not to individuals. Orders from new customers should be accompanied by a remittance in the form of a Post-Office or Express Money Order, Bank Check or Bank Bills.

**Prices.** The prices quoted are net, and do not include free transit, except for seeds in packets, ounces, or quarter-pounds, on which we pay postage or expressage anywhere in the United States.

Seeds by Mail or Express. If wanted by mail in the United States, add postage according to zone rate, as per table below, except for seeds ordered by the packet, ounce, or quarter-pound, which we will mail free. By special arrangement with the express companies, we can ship seeds and bulbs at a reduction of about 25 per cent from the regular rates. In view of the greater safety, it will be found best to send parcels of 15 pounds or over by express, as packages are apt to get crushed in the mail. Seeds may be sent C. O. D. when 25 per cent of the amount is remitted with order. Potatoes, onion sets, or other perishable articles, fertilizers or insecticides cannot be sent C.O.D.

Maximum weight, 70 pounds to 1st, 2d and 3d Zones, and 50 pounds from the 4th Zone upward. Postage to Canada 12 cents per pound, or fraction thereof, maximum weight, 4 pounds 6 ounces.

Name, Address, Etc. We beg our correspondents to give us on each order the correct name and address; also to indicate very precisely the means of carriage which they prefer, mail, express or freight, and the office or railroad station which best serves their locality. In case these directions are not followed out, or if they are not sufficient, we ourselves shall of course choose the most advantageous and convenient means.

Cultural Directions. These apply to the climate of them for and southern localities the necessary changes in time of sowing, etc., will readily suggest themselves to gardeners.

# **Warranties**

Seeds of best quality will sometimes fail through improper treatment. Thus, a small seed may be sown so deeply that the young plant cannot reach the surface. More failures result from disregard of the conditions necessary to germination than from inferiority of the seeds used.

These conditions are: A proper temperature, sufficient moisture and free access of air. Besides these, the soil must be in proper condition and present no physical obstacle to the growth of the young plant. If heavy rains have compacted the surface of the soil, and the sun has baked it to a hard crust, it will be impossible, even if all other conditions are favorable, for the seed-ling plants to force their way through it, and many perish from this cause alone.

Seeds differ greatly as to the temperature required for germination. Beets, Cress, Peas, etc., germinate rapidly at a temperature of 45 degrees, but if Melons and other seeds of that family, Bush or Pole Beans, and other plants of subtropical origin are sown under the same conditions, they will be apt to decay, as for their prompt germination they require a heat of at least 60 degrees. For this reason many seeds fail yearly from too early sowing.

The second condition, proper moisture, is likely to be violated by an excess rather than by too small a portion. The proper amount is that which a well-drained soil will naturally hold. Free access of air is all-important, and this is interfered with by an excess of water in the soil.

In germination, complex chemical changes take place in the seeds, in which the air performs an important part. A portion of the seed is consumed, carbonic acid gas being given off in changing the starch and other constituents of the seed into nutriment to forward the growth of the germ or embryo plant, which depends upon the contents of the seed until it forms roots below ground and leaves above, and is able to sustain itself.

WITCHE THE

ground and leaves above, and is able to sustain itself.

Besides these conditions affecting the germination of the seed, the young plants, after they have made their way to the surface, are liable to various accidents; a sudden current of very cold air, or a continuous drying wind may check their growth or destroy them altogether.

In addition, there are numerous insects, both below and above ground, that may attack the plants, some of them being so small that they often destroy a crop before they are discovered.

We may also mention the well-known tendency of many

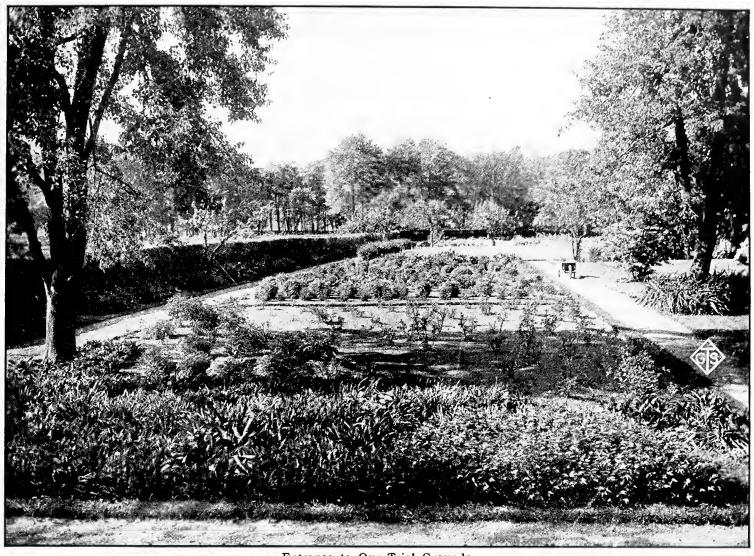

We may also mention the well-known tendency of many vegetables to revert to their original types, notwithstanding the care of the seed-grower; the Yellow-Podded Wax Beans becoming green, the Yellow and White Celery becoming more or less green, dwarf Peas becoming running corts, etc. running sorts, etc.

J. M. Thorburn & Co. give no warranty, express or implied, as to description, quality, productiveness, or any other matter of any seeds, bulbs, or plants they send out, and they will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned.

# DIRECTIONS FOR THE CULTIVATION OF VEGETABLES

TO SECURE a good crop of vegetables, three things are necessary, viz., a suitable soil, pure seed and clean culture. The exposure for a vegetable-garden should be south or southeast, or nearly so. The soil should be naturally rich and friable, a sandy loam being about the best. If the soil be stiff, it should be gradually mellowed by the free use of barnyard manure, or, if convenient, by the addition of sand. If wet, or inclined to hold an excess of moisture, it should be underdrained, preferably by tile, but if possible, a location should be selected naturally dry and free from surface water.

A dark-colored soil, or one supplied with a goodly portion of decayed vegetable matter, will produce the earliest crops. If the soil be shallow, it should be deepened gradually by plowing or spading an inch or two deeper each year, and not all at once by trenching or subsoiling, unless manure and money both be abundant. A sandy soil may be greatly improved by adding vegetable mold from the woods. To produce the best results, the vegetable garden should have at least I foot of good, rich soil. The roots of large trees should not be allowed to encroach on any part of the garden, though large trees, sufficiently far off, afford a valuable protection on the north and west.

If for any reason you think your soil is not right, consult your experiment station if necessary.

Mark the garden off into squares or beds of convenient size, to facilitate the practice of a rotation of crops, which is an important matter. As a rule, never let the same crop or kind of vegetable occupy the same bed or spot two years in succession. Pota-

toes, Onions and a few other things may form exceptions to this rule. Every year the beds must be warmed up by a liberal coat of manure, which should be thoroughly mixed with the soil. From seeds sown in drills, larger crops from a given surface are grown, and cultivation is simple and comparatively easy. The space between the drills, and other special information, is given in the body of this catalogue; the least distance is named, in order to economize space; it might be increased in some cases to advantage. The ground should be frequently hoed, to kill the weeds and to keep the soil mellow; and the proper time to hoe is just when the weeds appear above the ground.

Much time may be gained by starting certain kinds of plants in a hotbed, or even in a coldframe, the latter being a convenient thing, even on a small place. The hotbed is chiefly intended for raising early Tomatoes, Eggplants, Peppers, Cabbage, Cauliflower, Lettuce, etc., but as all these plants can now be bought cheaply of this company at the proper time, the expense and labor of a hotbed may be dispensed with, especially on small places.

To prepare a coldframe. The coldframe is simply a frame set on the ground, no bottom heat being applied. It is banked up on the outside during the winter with salt hay, straw, or coarse litter. The soil is prepared by forking in and thoroughly mixing to the depth of 10 to 12 inches a liberal quantity of old, well-rotted manure. The manure of an old hotbed is good for the purpose. The frame is prepared in the fall, and young Cabbage, Cauliflower and Lettuce plants are set out in it in time to get well

# DIRECTIONS FOR THE CULTIVATION OF VEGETABLES, continued

established before very cold weather. Cauliflower and Cabbage should be set down to the first leaf, and the scil made firm around the plants. The seed is usually sown, in the vicinity of New York, from the 15th to the 20th of September, but the very early kinds some 8 to 10 days later. The young plants will be ready to transplant in about 25 to 30 days. During the cold nights and stormy days, the beds should be closely covered with the sashes, and these further protected by straw mats or shutters. Cauliflower needs more and closer protection than Cab-

bage, as it is rather more tender. During mild days admit air freely, the object being to keep the plants in a dormant state, without actual freezing, so that when spring comes they are in a forward state for setting out early crops. Seeds of Cabbage, Cauliflower, Lettuce, and Radish may be sown in a cold-frame in the spring from the last week in February to the first week in March. The frame should stand in a warm and sheltered spot, and be kept from freezing by mats or a thick covering of straw during cold nights.

# DIRECTIONS FOR MAKING A HOTBED

In the vicinity of New York, from the first to the latter part of March is quite early enough to make a hotbed. The time must vary according to the latitude. Use fresh horse manure, and add to this, if possible, one-third to one-half of its bulk of leaves. Mix them thoroughly, tramping down the mass in successive layers, and form into a large pile, so that

fermentation will proceed.

In two or three days fermentation will be apparent by the escape of steam from the heap. Now turn again, and allow the heap to remain until the second fermentation commences. Make a pit  $2\frac{1}{2}$  feet deep, and of a size suited to the number of plants required. The pit will be better if built up of brick. It should be located in a dry, sheltered spot, facing the south or east, if possible. Hotbed sashes are usually  $3 \times 6$  feet, and one or two sashes will give early plants enough for a small family. The frame of the bed should be 18 inches high at the back and 12 inches in front, which will give the proper slope to catch the sunlight. Crosspieces should be placed for the sashes to slide on, to facilitate opening and shutting the frames.

When everything is ready, the manure is placed

in the pit and trodden down firmly in layers to the required depth, 2 to  $2\frac{1}{2}$  feet. Then put on the sashes and keep the pit closed until the heat arises. At first it will probably be 100 degrees or more, which is too hot to sow the seed in; but in two or three days it will subside to 90 degrees or a little less, when the soil may be put on to the depth of 6 to 8 inches. Try the heat by plunging a thermometer into the manure.

The soil should be of well-rotted sod (or common garden soil will do), mixed with about a third of fine old manure; and in this the seeds may be sown thinly in drills 2 to 3 inches apart, and afterward (as soon as out of the seed-leaf) either thinned out or else transplanted to another frame. Air must be given every mild day by raising the sashes at the back.

Water with tepid water whenever necessary, and during cold nights and snowstorms keep covered with mats or board shutters. Tomatoes, Peppers and Eggplants should be sown in a separate frame from Cabbage, Cauliflower and Lettuce, as they require more heat. Hotbeds may be made on the surface of the ground, if the manure extends a foot wider on all sides than the frame.

# Collections of Vegetable Seeds

Only the choicest varieties are put into the assortments, and they are picked out so as to give a continuous supply of vegetables from your garden all season.

The amount charged for these collections is considerably less than you would pay for the individual seeds, on account of the fact that we are able to put them up during the slack winter months.

Owing to this, we cannot permit any alterations in the varieties, and the reduced price will not be allowed unless the collection is taken in full and without change.

# Collection No. 1, \$4 Including free delivery in the United States

Gotten up for a family of two or three persons. It is a rather complete list of varieties.

# Collection No. 4, \$36 Including free delivery by express in the United States

If you require quite a quantity of fresh vegetables, and you have about three acres that you wish to make into a garden, you could not do better than to buy this collection. There are quite a number of private estates and farms that are now doing away with the trouble of going through lengthy lists of vegetables suitable to their needs, and are leaving the matter to our judgment. This collection represents our recommendation as to just what should be used, with the exact quantities for planting approximately three acres, and getting the most out of the land.

# Desirable Vegetable Seed Specialties

### **Marvel of Paris Bean**

Slender, flat, green pods, 5 inches long. Early, productive, very tender, brittle, fine grained, of excellent quality. Lb. 90 cts., 2 lbs. \$1.75.

# **Green-seeded Flageolet Bean**

To be used as a Shell Bean only. Tender and of fine flavor; seeds keep their green color when fully dry, and even when cooked. Lb. 90 cts., 2 lbs. \$1.75.

# Dwarf Green-podded Bean Masterpiece (Sutton's)

The plant is a robust grower, very prolific, and the pods are straight, handsome, very tender, and stringless. Early and well adapted for forcing; an exceptionally fine green, round-podded variety. Pkt. 15 cts., lb. 90 cts., 2 lbs. \$1.75.

# Brussels Sprouts, Thorburn's Improved

We grow this specially for the private and market garden, and consider it the best strain produced anywhere. Oz. 85 cts., ½lb. \$3.

# Thorburn's Gilt-edge Cauliflower

Best and surest of all. Produces large, heavy, solid, white heads of finest quality. Undoubtedly the best variety. Pkt. 25 cts., oz. \$4.

# Early Jersey Wakefield Cabbage THORBURN'S SELECTED STOCK

Undoubtedly the finest strain of this most popular, well-known early Cabbage in cultivation. The heads are extremely solid, pyramidal in shape, with very little outside foliage. Pkt. 10 cts., oz. 45 cts., ½4b. \$1.25, lb. \$4.50.

# Extra-early Nordheim Sweet Corn

The earliest Sweet Corn in cultivation. Produces stalks from 6 to 7 feet high, each bearing three or four nearly perfect ears of finest quality. On style of Minnesota, but far exceeding that variety in the deliciousness of its flavor, as well as in earliness and productiveness. ½lb. 30 cts., lb. 50 cts., 5 lbs. \$2.25.

# Golden Evergreen Sweet Corn

Late; very sweet, round grains; beautiful table variety. ½lb. 30 cts., lb. 50 cts., 5 lbs. \$2.25.

# Thorburn's Early White Perfection Corn

A valuable second-early sort, producing good-sized ears. The cob is small and the grain is almost white. It is a heavy yielder, very sweet, and an almost perfect type, without flint or glaze. One grower says of this Corn that it is one of the best varieties of Sweet Corn ever seen in the field. ½lb. 30 cts., lb. 50 cts., 5 lbs. \$2.25.

# Cucumber, Thorburn's Noroton Selected White Spine

A selection of the Improved White Spine, but earlier, more perfect in shape and more prolific. The best slicing variety we have seen, being solid in flesh, fine-grained, tender and of delicious flavor. Vigorous, healthy grower. A splendid sort for the home garden, and absolutely without an equal for market. Pkt. 10 cts., oz. 20 cts., ½1b. 60 cts., lb. \$2.

# Celery, Thorburn's Gilt-edge Golden Self-blanching

Golden Self-blanching is the variety of Celery par excellence, and we can recommend our strain with every confidence. The chief characteristics of this sort are its self-blanching qualities and the beautiful waxy yellow appearance of the stalks. It is of compact, heavy growth and produces stalks that are brittle and crisp in the extreme and hearts that are large and solid. Pkt. 20 cts., oz. \$1, 1/4lb. \$3, lb. \$10.

# Thorburn's Big Boston Lettuce, Improved

Our strain of this well-known and most popular sort is without doubt the finest in existence. It is too well known to require any lengthy description. It is sufficient to say that it is equally valuable for growing in greenhouses for winter use, in frames for spring, or for sowing the seed in the open ground for use in summer and fall. It is unequaled by any other variety for crispness and tenderness; produces large, solid heads with few outside leaves, and stands long before running to seed. Pkt. 5 cts., ½lb. 50 cts., lb. \$1.50.

# Egyptian Deity Muskmelon Persian Delight

A new Melon of Cassaba type, from South Africa, said to be very fine quality. Pkt. 10 cts., oz. 20 cts.

### **Denia Onion**

Imported from Spain. Very large, globe-shaped, pale yellow. This is the Onion shipped to this market from Spain. Pkt. 15 cts., oz. 75 cts., 1/4lb. \$2.

# **Tomato, Perfection**

Large, smooth, blood-red fruit, 10 days earlier than the well-known Stone variety. Very desirable for the home-garden. Pkt. 10 cts., oz. 50 cts., 1/4lb. \$1.75.

# Turnip, Snowball

The best variety for the summer garden; pure white; delicate flavor. Oz. 20 cts., 1/4lb. 60 cts.

# Flower Seed Novelties and Specialties of Merit

# Adonis Aleppica, The Syrian Flos Adonis

This most beautiful annual grows to a height of 16 to 20 inches and produces 16 to 20 chief stems. From these there are many lateral branches, each ending in a round flower, about four times as large as those of the common Flos Adonis. Color is a brilliant, dark red; free blooming; very floriferous; handsome feathered foliage; excellent for cutting and as a pot plant. May be started in a coldframe or sown in the open ground early in spring. It takes, under normal conditions, four to six weeks for it to germinate, but occasionally six months to one year. Autumn sowing does not succeed. Pkt. 50 cts.

# Antirrhinum nanum grandiflorum, Peace

Of compact growth, not exceeding 15 inches in height, and with distinct narrow foliage. This beautiful new variety bears shapely flowers of a lovely rose-pink, with slight salmon shading. Pkt. 50 cts.

# Aster, Hercules White

A new type of great merit. In form it is similar to the well-known "Ostrich Plume," but of dwarfer habit. It is a strong grower and produces very large, pure glistening white flowers of a refined shape. Pkt. 25 cts.

# Aster, Vick's Early Branching Rosy Red

A new color, darker than rose, lighter than crimson—a beautiful rosy red. Plants are more vigorous and larger than any other shade of red. Pkt. 25 cts., 2 pkts. 40 cts.

# Calliopsis radiata "Tiger Star" (hA)

A rich and continuously blooming annual, with peculiarly colored dark brown and golden yellow tigered flowers, the petals of which are curiously twisted like the cactus dahlia. Of easy culture, growing in ordinary garden soil and producing its strikingly colored flowers in great abundance all summer. Grows 8 inches high and forms a round, compact bush. The unique form and coloring of the flowers will appeal to those who like oddities. Pkt. 15 cts.

# Calceolaria, Covent Garden Strain

Extra choice; recommended for habit, size and marking of flowers. Pkt. 30 cts.

Double Crested White Queen. These	
double-crested varieties are not fully double,	
but are double-crested, having double cen-	
ters and a row of petals around the base of	
the flower, making them very effective	15

# Chrysanthemum maximum laciniatum, White Comet Marguerite

Of remarkable beauty, quite different from all other varieties, the petals of this novelty come in light, tufty waves, partly covering the yellow center of the flower, creating a graceful, charming effect. About 40 inches high, with long, strong stems; flowers abundantly in July and August. Pkt. 50 cts.

# Dahlia, "Peter Pan"

This new dwarf Dahlia is quite unique, both in habit and in form of flower. The wonderfully compact little bushes begin to bloom when barely a foot in height, and do not exceed 18 inches to 2 feet. The flowers may be described as anemone-shaped, with tubular center and outspread ray florets, in many combinations of bright colors. Pkt. 50 cts.

# Delphinium, "Blue Gem"

A plant of compact and bushy growth, giving an abundance of bloom. Height 9 to 12 inches. The flower is large and of a beautiful deep blue. Of good, compact habit; an excellent pot plant. Pkt. 50 cts.

# Eschscholtzia, Vesuvius

Wallflower-red, same color inside petals as outside. Pkt. 10 cts.

# Lupinus polyphyllus, "Lavender Queen"

Very pretty lavender, tinted rose. A lovely new shade. Pkt. 30 cts.

# FLOWER SEED NOVELTIES AND SPECIALTIES OF MERIT, continued

# Myosotis "Blue Eyes" FORGET-ME-NOT

A strong-growing, free-blooming, compact variety; color bright blue. 12 inches. Pkt. 25 cts.

# Pansy, "Apricot Queen"

Distinct new bedding variety; very compact and free-flowering, of a pretty apricot, shaded yellow. Pkt. 25 cts.

# **Double Queen Poppies**

A lovely strain of hardy annual Poppies. Abundant flowers of the Shirley type, but double, of the most delicate and brilliant colors, ranging from palest pink to rosy scarlet; many charming selfs, others beautifully picoteed various red shades. Fine cut-flowers. Pkt. 25 cts.

# **Lilliput Poppy (Papaver Rhoeas** pumilum)

This new introduction represents a very dwarf class of the single-blooming Shirley Poppy. Height 12 to 14 inches. Each tuft develops straight peduncles, standing about 2 inches above the leaves and ending in a mass of from 60 to 120 flowers, 1½ to 2 inches in diameter. Color mostly light or dark rose, with golden yellow anthers; blooms all summer. Sow in the open ground either in spring or autumn. Pkt. 30 cts.

# Sweet Peas (Spencer), "The Cardinal"

Brilliant, intense, poppy-scarlet; bears four large, waved flowers to a stem. The best sunproof scarlet. Pkt. 15 cts., oz. 40 cts.

# Stocks, Mammoth Ten-Weeks, "Heatham Beauty"

A new and quite distinct color, pyramidal habit, with very large flowers of a rich mauve, shaded terracotta. Pkt. 30 cts.

# Stock, Nice, Early Giant-flowering Winter, "Aurora"

In habit and large size of flower, Aurora compares with the grand Giant Nice varieties. Produces huge spikes thickly studded with large blooms, of a lively golden buff, suffused with rose—a splendid color. Pkt. 50 cts.

# Schizanthus grandiflora, Hybrid

Mayblossom. Pale rose-pink and white, free from any markings or darker tints; dwarf, compact, pyramidal habit. Pkt. 25 cts.

# Thermopsis Caroliniana

"ST. PETER'S STAFF"

Pretty yellow, pea-shaped flowers, adapting itself to almost any situation, but succeeds best in a light, rich soil. They are deep-rooted plants and endure drought very well. Pkt. 15 cts.

# Verbena hybrida, "Lucifer"

Intense brilliant scarlet, with no eye. A great improvement on Defiance. Pkt. 30 cts.

# Verbena hybrida grandiflora (Mammoth), "Rose Queen"

Originating from the well-known variety, "Helen Willmott," this superb new sort bears flowers of a lovely delicate rose. Blooms are unusually large, 20 to 30 of them often being grouped on a single umbel, producing a magnificent effect. Blooms very early. Pkt. 50 cts.

# Verbena hybrida grandiflora (Mammoth), "Scarlet Queen"

Flowers of the most vivid scarlet, with a large and distinct white eye. The blooms are very large, with a long season of blooming. Pkt. 50 cts.

# Verbena hybrida gigantea, Mixed

Giant florets the size of a fifty-cent piece. Pkt. 30 cts.

# New Double Semi-dwarf Wallflower

The plants grow 18 inches high, colors ranging from golden yellow to brown and purple. saved from extra-selected plants. Pkt. 25 cts.

# Zinnia elegans robusta grandiflora, "Achievement"

Distinct from all other Zinnias. Rich variety of colors; free and strong grower, producing an abundance of double flowers; blooms attain a diameter of 5 to 6 inches. Excellent as a cut-flower. Pkt. 30 cts.

# Zinnia elegans robusta grandiflora plenissima, "Rose King"

This grand new giant Zinnia bears flowers of a beautiful carmine-rose tint, of immense size, probably surpassing those of any other Zinnia. 50 cts.

# **VECETABLE SEEDS**

Please notice that we pay postage or express charges on all garden seeds ordered by the packet, ounce and quarter-pound. If larger quantities are ordered to be sent by mail, add postage at zone rates. See second cover and pages 4 and 5 of this Catalogue for COMPLETE COLLECTIONS OF VEGETABLE SEEDS of approved and choice sorts from \$1 to \$36, and page 62 for CHOICE COLLECTIONS OF FLOWER SEEDS.

Some varieties of seeds may again be late in reaching us this season. Under the circumstances it will be well, therefore, to state when ordering, whether we are at liberty to substitute or not. Customers can depend upon our using our best judgment in substituting other equally good sorts for those ordered which we may not be able to supply.

# ARTICHAUT ARTICHOKE Alcachofa

Culture.—Hardy perennial requiring protection in our climate. Deep, rich, sandy loam with plenty of well-rotted manure. Sow seeds ½inch apart in April or May, and when plants are large enough, transplant into rows 3 to 4 feet apart and 2 feet in the rows. They reach maturity the second year. When cold weather sets in, bank the earth to the top, first cutting off and tying up the leaves to protect the heart of the plant from soil, so that they will occupy less space, and in the spring uncover each plant and fork in a dressing of manure. Artichoke may also be treated as an annual by sowing the seed in hotbeds during February, potting the plants to avoid setting back and transplanting in May when frosts are past. Seedlings should give edible heads the same summer. The heads should be cut off and used as they get ready. If left to ripen on the plant, they will exhaust it, and no more will be produced that season. Heads are unfit for culinary purposes after the flowers expand.

Pkt. Oz. 1/4lb.

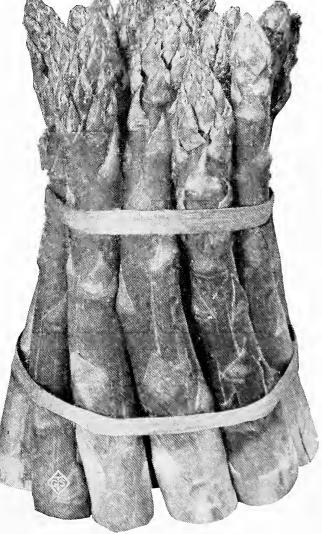

# **ASPARAGUS**

Asperges Esparrago

CULTURE.—Sow the seed thinly in rows I foot apart in April or May (4 or 5 pounds to the acre; I ounce will sow a 50-foot row), and keep down all weeds. To secure strong, healthy plants, thin the seedlings to 3 or 4 inches in the rows, saving only the strongest. The one-year-old plants should be set out in spring in rich, sandy loam, dug 18 inches deep, into which has been worked plenty of well-rotted manure. If a stiff clay soil is all that can be had, add plenty of sand and sifted coal ashes to loosen it up, and also see that it is well under-drained. In planting for private use, set out in beds 5 feet wide, three rows in a bed, the outer being each I foot from the edge, and allow 18 inches between the rows; set the plants from 4 to 6 inches below the surface, 2 feet apart. If set out in autumn, top-dress with 6 inches of manure. For market, on a large scale, set out 4 by 11/2 feet. Every fall apply a good dressing of coarse manure, after the tops have been cut, and in spring fork in. Never cut too closely. The roots need the benefit of some foliage during the year, else they will weaken and die. Slugs are easily destroyed by applying air-slaked lime or paris green. Asparagus from seed does not always come true to name.

<sup>T</sup>n France a business is now made of growing small, green, delicate shoots of Asparagus during the winter. Strong roots may be forced in hotbeds out-of-doors. They should be packed closely into the frames, and by making a new bed every five or six weeks these tiny shoots may be had all winter and are valuable served with omelets, green peas, etc.

# BEANS

As a farinaceous food for man, the Bean is considered far superior to any other legume, and next in importance to wheat. The modern varieties leave little to be desired; the great care given to their improvement has resulted in superior sorts, greatly extending the season of use, as well as varying the flavor.

Culture.—About the first of May, if the ground is perfectly warm, select a warm, dry sheltered spot, any good soil, preferably a moist, deep loam, not over-rich in nitrogen, dig and manure very slightly; make drills 2 inches deep and 18 inches to 2 feet apart; drop the Beans 3 inches apart in the drills and cover not more than 2 inches deep. Hoe well in dry weather to keep down the weeds. Sow every two weeks up to about August I, for a succession. Two pounds (I quart) to 100 feet of drill; I to 1½ bushels (60 to 90 pounds) to the acre, in drills. For quick results, soak the seeds before planting.

# ENGLISH DWARF BEANS

FEVE DE MARIAS Haba

CULTURE.—Sow in drills 2 feet apart, the Beans 3 to 4 inches apart in the rows, and 2 inches deep, as early in the spring as the ground can be worked (these are as hardy as peas), in order to get them into pod before the heat of summer. May be sown under glass in February and planted out when well hardened, as soon as the ground is fit, earthing up slightly against late frosts. When in pod, break off the top of the

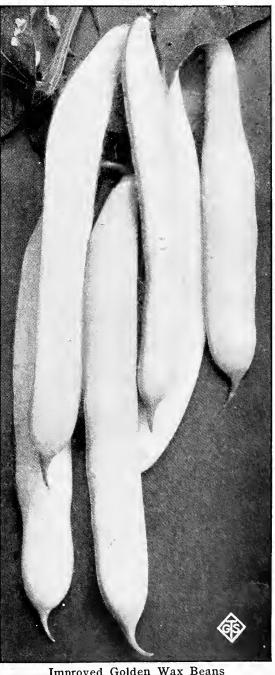

plant to check the growth. Plant and hoe the same as for Dwarf Beans. A strong soil suits them best. Properly cooked, these Beans form one of the most delicious vegetables. To each half gallon of water allow one heaping tablespoonful of salt. The Beans should be young and freshly gathered. After shelling, put them into boiling water, salted as above. Boil rapidly for fifteen or twenty minutes, then serve with a sauce of parsley and butter. Boiled bacon is often served with the Beans. Add postage at zone rates.

### BEET Remolacha BETTERAVE

CULTURE.—Sow as early in the spring as the ground can be worked (I ounce to 50 feet of drill; 5 or 6 pounds to the acre), and every two weeks after for a succession up to the first week of July. For general crop, sow about the middle of May. The soil should be light, sandy loam, well enriched with stable manure and plowed and harrowed until very fine. For long Beets the soil should be rich and deep, well pulverized and not re-

cently manured. The Turnip Beet matures in 60 to 75 days; the long varieties require the whole season for their growth. Sow in drills I foot to 15 inches apart, and when well up, thin to from 4 to 6 inches. The young Beets, with their tops, pulled out of the row, are excellent used as a spinach. For this purpose, sow frequently and use when of the size of a hickory nut.

# MANGEL-WURZEL AND SUGAR BEET

CULTURE.—As all Mangels require a deep rich soil in order to grow well, plow and subsoil at least I foot to 18 inches and apply plenty of rich stable or our Complete Manure. Sow in May or June, in rows 18 inches to 2 feet apart, and thin to 8 to 12 inches in the rows. Young plants may be transplanted to fill up vacancies. Sow in addition, when the plants are 3 to 4 inches high, at the rate of 200 pounds of Complete Manure, 200 pounds of bone meal and 400 pounds of salt to the acre. As soon as frost occurs, dig the crop. In order to be well preserved for gradual consumption during the winter, the roots should be heaped to a height of perhaps 6 feet, on a dry, sloping situation; cover at first with a piece of canvas and as the cold increases this should be replaced by about 6 inches of either salt hay, straw, seaweed or cornstalks, with a light layer of earth on top. As soon as this surface soil becomes frozen, about 6 to 8 inches more of earth should be placed over it. By following up this gradual process of covering, all danger of heating will be obviated, and the roots will keep in perfect order. Sow from 5 to 8 pounds to the acre.

# BORAGE

BOURRACHE

Borraja

The young leaves of this annual, which smell somewhat like a cucumber, are used as salad, or boiled like spinach. Should be sown to the depth of ½ to I inch, at intervals, as the leaves are palatable only when young. Sow in the spring, in light soil; transplant in shallow drills, I foot apart, when of six weeks' growth. 240. Pkt. IO cts., oz. 30 cts., ¼lb. 85 cts., lb. \$3.

# BROCCOLI

Broccoli

Broculi

CULTURE.—Sow early sorts as soon as the ground can be worked in the spring, in shallow drills, drawn 3 or 4 inches apart. Plant out 2 feet apart each way when the plants are about 4 inches high. Cultivate same as cabbage, in rich, moist, and moderately deep soil, and use the same remedies for insect attacks. The inner leaves should be tied over the head as soon as formed. The following are sorts best adapted to this climate; they are excellent and deserve much wider culture than is usual in this country. One ounce will produce about 2,000 plants.

Aigburth Brussels Sprouts

# **BRUSSELS SPROUTS**

CHOU DE BRUXELLES

Berza de Bruselas

Brussels Sprouts is, without exception, the best winter vegetable that can be grown. It is as hardy as the common curled greens. The Sprouts, which are about the size of a marble and very firm, fairly melt in the mouth when just cooked through.

Culture.—For early crop, as soon as ground is fit, sow thinly ½inch deep in seed bed with rows I foot apart. Thin to 2 inches or more apart; transplant in June so that plants stand at least I foot apart and rows I½ feet apart; for late crop proceed as above, except that seed is planted early in June, I inch deep, and is transplanted about August I. Rich loam is best. If soil is sandy, dig in compost around each plant or mulch to conserve moisture. As the Sprouts begin to grow big, break off the leaves near them. When the Sprouts are full size, cut as wanted, but not too close—sometimes other Sprouts will start in their places.

# **CAULIFLOWER**

CHOU-FLEUR

Coliflor

Culture.—The same as for cabbage except that extra manure and plenty of water will pay upon Cauli-flower. If the soil be dry, water frequently, and, if the plants have a heavy mulch of hay or straw, it will keep the soil moist, and they will not suffer from drought. Cauliflower can be grown for an early crop by starting the seed under glass late in February or very early in March. Prick out the seedlings once. Keep them stocky but do not stunt. Harden off to set out when the soil is in best condition in April. The late kir. Is may be planted out the same time as cabbage. It is also possible to get a late crop by sowing the early varieties in seed-bed early in June, transplanting when about 5 inches high, giving the plants liquid manure or nitrate of soda.

When the heads form and begin to push aside the small leaves, tie the larger leaves together over the center, leaving some loose, to exclude rain and sun; see that the worms have been previously exterminated.

Thorburn's Extra-Early Dwarf Erfurt. The best and earliest for forcing; very dwarf and compact, with short stem and small leaves. The curd is very tender and exceedingly fine flavored. Should not be confounded with antipolar different parts advertised. Price if obtainable 2250

# CHOU CABBACE Col repollo

CULTURE.—Soil for Cabbage should be rich and heavy loam, with good drainage. On such a soil, with an abundance of stable or our Complete Manure, excellent crops are sure to be grown. For early spring, sow in fall, not too early, for the plants are liable to bolt in the spring instead of heading. In a month the plants will be fit to transplant to coldframes, where they are wintered, taking care in planting to set the young plants down to the first leaves. Transplant in spring as soon as the ground can be worked, setting the plants 2 feet apart one way and from 12 to 18 inches the other, according to the variety. If it is desirable to economize space, lettuce or radish may be sown between the rows, as they will be out of the way before the Cabbage needs the room. For late or winter crop, the seed is sown in May, and the plants set out in July. In this case, they are set in rows 2 by 3 feet, so as to work them with a horse and cultivator. One ounce of seed will produce 2,000 to 2,500 plants. The culture for Cabbage should be clean and regular. Do not allow the ground to dry out, for if the plants are checked in their growth, and then are saturated by a good rain, the heads are likely to split. By deep raking, therefore, maintain a good mulch over the Cabbage patch. To destroy the green worm, an experienced grower says: "Take one ounce of saltpeter and dissolve it in 12 quarts of water; then take a short-handled whisk-broom, dip it in the solution and sprinkle the plants well. One application is sufficient unless the stuff is washed off by heavy rains. The liquid being perfectly clear, never colors the cauliflower or Cabbage heads." To prevent the turnip flea attacking the young plants, sift fine air-slaked lime or tobacco dust over them as soon as they appear above ground. Against Cabbage pests generally, keep down all weeds and burn the rubbish of the patch.

# CARDOON

CARDOON

Cardo

CULTURE.—Sow early in spring, ½ to 1 inch deep, in rows 3 to 4 feet apart, where the plants are to stand, and thin them, when well up, to 2 feet apart. Soil should be moist, rich, and deep. When full size, bind them together with bast or raffia, and earth up like celery to blanch. The stems of the leaves are used for salads, soups and stews. The stems may be wintered in a dark cellar away from frost.

Large Solid. Smooth; grows about 4 feet Oz. 1/4lb. Lb. high; leaves nearly free from spines....

.....pkt. 10 cts...2770 \$0 40 \$1 25 \$4 00

CARROT

CAROTTE

Zanahoria

CULTURE.—Sow No. 2890 as early as the ground can be worked; or, for late crop, until the latter part of July, or early in August for a winter crop. This is the finest and most tender for table use. For main crop sow other sorts from middle of May to the first of July. The soil must not be allowed to bake over the seeds as they germinate slowly. The seedlings are delicate and require careful cultivation until the tops cover the

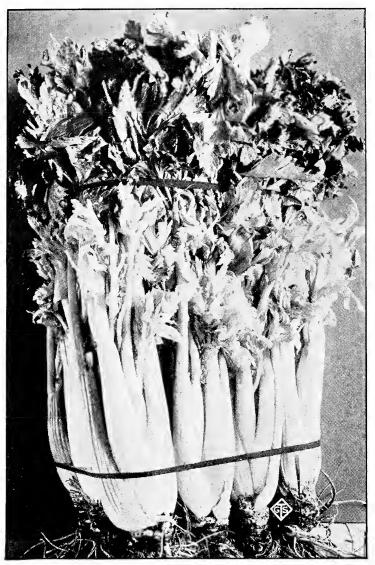

ground. Thin out early crop to 5 inches in the row, main crop, 6 to 7 inches, the rows 10 inches apart for early crop, 14 inches for main crop. Hoe often and deeply between the rows. Soil should be light, rich, and loamy, richly manured (but not recently, except for the short varieties), and deeply dug. Sow at the rate of 2 to 3 pounds to the acre; I ounce to 100 feet of drill. Carrottops cut from fairly young plants may be used for pretty indoor greenery. Put one cutting into each thumb-pot, or three or four into a larger pot around the sides. Fairly good and sandy soil should be used, syringing frequently until growth is well forward. About I inch of Carrot should be left to put in soil, but this should be surrounded with soil or moss to hide it. When fully grown it is very pretty, the long fronds hanging over gracefully.

Early Scarlet Horn Carrot. For open air,

Thorburn's Gilt-Edge Golden Self-Blanching Celery

# **CELERY**

CELERI Apios

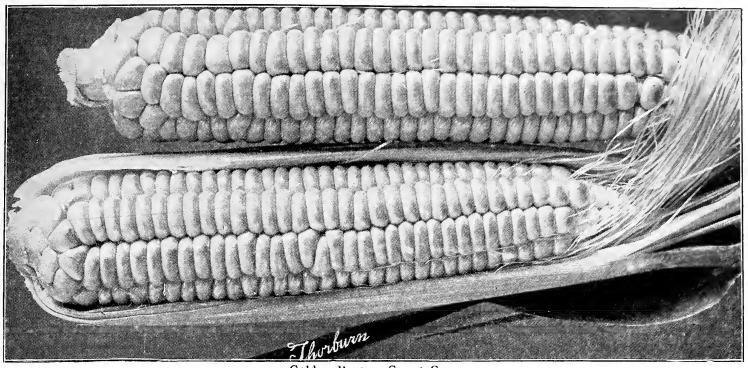

Culture.—Sow the seed in a light, rich, dry border as early as the ground can be worked, in drills 8 to 10 inches apart, and cover the seeds about 1/4 inch deep, rolling or treading them in if the ground be dry. One ounce will be sufficient for 2,500 to 3,000 plants. When fairly out of the seed-leaf, they may be transplanted to another bed, or they may be thinned out to 6 or 8 inches apart, and let grow until wanted to plant out in beds or trenches. The beds should be kept well weeded, and an occasional soaking with water in dry weather will do the plants good. Early in July in the North, a month or six weeks later in the southern states, is the proper time to set the plants out in beds or trenches. Cutting the tops keeps them back. Cut off tap-root when first transplanted, and press the soil firmly against the roots. In the garden the better way is to set the plants in shallow trenches. We say shallow, for it is obviously a bad plan to remove all the good soil (as must be done in a deep trench) and put the plants in that which is poor. The plants must be set in a single row in a narrow trench; or the trench may be made into a bed wide enough to hold two, three or four rows, I foot apart, and the plants about 8 inches apart in the rows, and in this case the plants are in compact form to be covered for the winter where they grow. This will save much labor where there is no root-cellar for storage, as often happens to be the case. The bed should be made very rich with thoroughly decomposed manure. The plants will need to be earthed up two or three times, the first time when the plants are 4 inches or more above the ground so that the stalks will protect the center from contact with the earth. Care should be taken

not to let the earth get into the heart of the plant. In field culture, the plants are set on the surface in rows 4 feet apart when the Celery is to be earthed up in the field for early use, and 2 feet apart when the plants are to be taken up and blanched in the cellar for winter use. The plants are set 6 inches apart in rows. If not grown in beds, the best way to store is to dig trenches in a well-drained spot in the open ground I foot wide, and at a depth of a few inches less than the height of the Celery. The plants are then lifted and set close together. When severe cold weather comes on, cover gradually with leaves, hay or straw, and place boards on top. The turnip-rooted Celery (Celeriac) needs no earthing up, and may be planted in rows I to I ½ feet apart, the plants 9 inches apart in the rows, cutting off the tap-root when transplanting. Keep the earth from the heart of the plant in cultivating. Fertilize with nitrate of soda or liquid manure, lightly, after transplanting. When the knob-roots are well formed keep the suckers and side roots trimmed off. Early spraying with bordeaux mixture is extremely efficacious in case of Celery blight or rust.

Golden Bantam Sweet Corn

# CORN, SWEET or SUGAR

CULTURE.—As soon as danger from frost is past plant in hills 3 feet apart each way, and five or six kernels in a hill. The hills should be prepared before planting by digging in a shovelful of compost and a double handful of high-grade fertilizer. In spring plant 1 inch deep; later plantings 1½ to 2 inches deep. Thin out to three plants in the hill, or if in rows, to 12 inches apart. Two pounds will plant 150 to 200 hills. Hoe often and draw soil up to stem; break off side shoots. Corn requires a warm rich soil and a sunny exposure. Plant for succession every two weeks until middle of July. If sown thinly in drills, a greater yield from a given surface will be obtained.

We supply packets of Corn at 15 cts. each, postpaid; for other quantities, not prepaid, add postage at the zone rates. Most varieties can be furnished on ears at 10 cts. each, transportation extra

I foot. As soon as the soil becomes warm plant the roots close together in rows, all crowns at same level, each row 6 inches apart. Cover with 8 inches of very light soil. There are also systems of hot-water pipes used in place of manure for forcing this vegetable.

\$1.25 for 20, \$3 for 50, \$5 per 100.

# COLLARDS

CULTURE.—Sow seeds in a rich, moist soil, as for cabbage, in June, July and August for succession. One ounce will give 2,500 to 3,000 plants. Transplant when a month old in rows a foot apart each way and hoe often.

Oz. 1/4lb. Lb.

Georgia......pkt. 5 cts...4380 \$0 20 \$0 60 \$2 00

# CORN SALAD, or FETTICUS

Масне

Macha o Valerianilla

Culture.—Sow during August or early in September, in drills ¼inch deep and 6 inches apart, for spring use. If the weather is dry when the seed is sown, tread it lightly to insure germination. Soil should be light and warm, with previous manuring. Keep weeds down with hoe. Just before the winter cover thinly with straw or leaves. The leaves should be picked when half as large as lettuce. A second crop may be picked from the same plant.

Pkt. Oz. ¼lb. Lb.

# **CRESS**

Cresson

Bara o Mastuerzo

Culture.—Sow No. 4520 thickly in shallow drills, ¼inch deep, and a foot apart early in spring, every two or three weeks until warm weather, in good garden soil; if moist, cool and rich, all the better. One ounce will sow 50 to 100 feet. Begin to sow again from the middle to the end of August every week or two for fall succession. It should be cut often and it will continue to grow. It is useful not only for salad, but for the breakfast table and for garnishing. No. 4570 should be sown in damp soil but not muddy; or, if a stream of water can be utilized, they will be much finer. They will also thrive well in damp hotbeds. Rightly managed, their culture is very profitable. To obtain early salad, it is a good plan to sow with Water Cress seed a strip 4 inches wide on the outer margin of a hotbed, inside the frame, where it is always cool. Do not pick until the plants are growing well, and do not pick more leaves than the plants can readily replace.

# CUCUMBER

CONCOMBRE

Pepino

Culture.—For very early, sow in hotbeds upon pieces of sod, or in small pots. They can be readily transplanted with a gain of about six weeks over those sown in the open ground. Plant out in rich soil when danger of frost is over, or protect by hand-glasses, or by paper held down at the corners with a handful of earth. For general crop, sow in the open ground as soon as the weather is settled and warm, and every two weeks for a succession. Sow the seed about ¾inch in depth. One ounce will do for 60 to 70 hills. Thin, leaving four or five of the strongest seedlings in a hill. For pickles, sow from middle of June to first week in July. Sod land, turned over in fall, is the best for them. Plant in hills 4 feet apart, putting a shovelful of well-rotted manure in each hill. Fresh manure will make the plants run to vine. For mildew and wilting spray with Bordeaux. For beetles and other insect pests, spray with tobacco water and whale-oil soap, reaching the underside of the foliage, or dust with tobacco dust.

All 5 cents per packet, except where quoted otherwise	Oz.	1/41b.	Lb.

### **ENGLISH CUCUMBERS FOR FRAMES**

(Concombre especes Anglaises pour couches)

Culture.—Sow seeds in October, November, or December, according to the time they are wanted, in small pots, in fibrous loam, lightened and enriched with old manure; give plenty of air and water. Plunge the pots in a frame near the glass, where there is a little bottom heat, and keep them covered with brown paper until the seeds germinate. Afterward uncover and ventilate to insure sturdiness of habit. Only strong plants should be employed. It is necessary to fertilize the pistillate flowers with the staminate to render the vines productive as, owing to the absence of flies or bees, they will not produce a crop under glass as in open ground.

# ENDIVE, or CHICORY

CHICOREE

Escarola o Endivia

Culture.—Sow in June, July or August, in good, rich garden soil; cover lightly; when up, thin out to 8 or 10 inches apart and water well, if dry; or sow under glass in March or April, transplanting and hardening off. Then set out in the open as soon as ground is fit. The young plants will do well, if dressed at least once with nitrate of soda or liquid manure. When the leaves are 6 to 8 inches long, blanch by tying together near the top with yarn or raffia. (They must be quite dry, or they will rot.) At the approach of winter, take up carefully, with a ball of earth to each plant, and place close together in frame or cellar. They must

### **ENDIVE** or CHICORY, continued

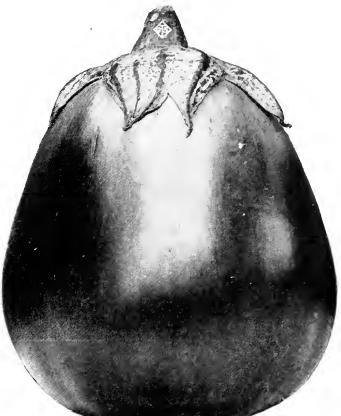

be kept dry and have plenty of air. To blanch, tie the tops of the heads together, to keep the light from the heart. One ounce of seed will plant a 100-foot row.

# **EGGPLANT**

AUBERGINE Berengena

CULTURE.—Sow in hotbeds very early in spring and transplant when 2 inches high into a second bed or into small pots. If this is not done, thin to 4 inches apart. Do not plant out until weather is perfectly settled and warm. Cool nights or wet weather will check them. Soil should be a rich, sandy loam and exposed to the sun. One ounce will plant 2,000 plants or more. Keep some back in frames for a second planting, in case of weather changing unexpectedly. Set out plants 3 by 2 feet. Dress the young plants once after thinning or setting out with nitrate of

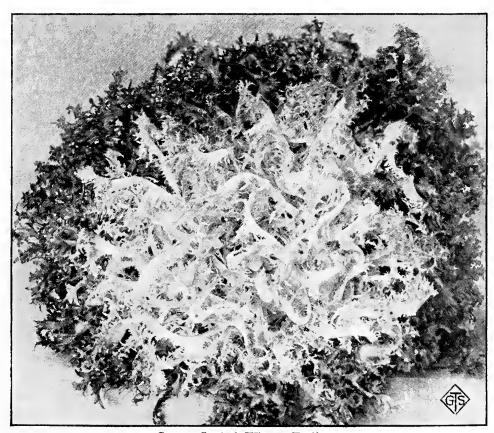

New York Spineless Eggplant

plants once after thinning or setting out, with nitrate of soda, or liquid manure.

# POIREAU LEEK Puerro

Culture.—Sow very early in spring, in drills 6 inches apart and I inch deep, one ounce to 100 feet of drill. Thin out to I inch. When about 7 inches high, transplant in rows 12 inches apart, as deep as possible, but do not cover the young center leaves. Water thoroughly if dry when planted out. Draw earth up to them as they grow; deep, rich soil is required. Dress twice, and freely, ten days apart, with nitrate of soda or liquid manure. If they need water, give it to the roots through a pipe thrust down among the stems,—taking care not to wet the leaves. Take up and store in earth in a cool cellar before winter weather. The seeds may also be sown in September and wintered under frames, and the young plants transplanted in spring to where they are to remain.

# LETTUCE

Laitue Lechuga

CULTURE.—Sow 6030, 6120, 6230, 6340 and 6350 in hotbeds in March, and these as well as all the other varieties in the open ground as soon as it can be worked, and transplant in rows 8 inches apart and rows I foot apart. Sow in two weeks' time again for a succession; also Cos sorts. Latter part of August, sow any of the varieties. In October some of these may be planted in frames, to head in winter and early spring. One ounce is sufficient for 1,000 plants or 300 feet in rows. Sow ½ to 1 inch deep—if under glass, ¼inch. Always sow thinly and thin out well, or the plants will not be strong. The last spring sowing had better be grown where sown, being thinned out to 6 to 8 inches apart. Cos Lettuce may be sown in a hotbed early in the year and transplanted to a coldframe, so as to have good plants to set out at the opening of the ground. Lettuce requires good ground, enriched with thoroughly rotted manure, and well pulverized. The after-culture should be close and careful, to secure the best results. Lettuce seldom, if ever, heads well in hot weather. All 5 cents per packet

**MUSHROOM SPAWN** 

BLANC DE CHAMPIGNON

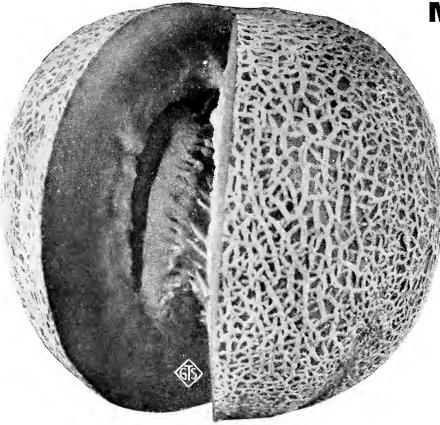

Culture.—Mushrooms may be grown in cellars, under benches of greenhouses, or in sheds, wherever the temperature of 50 degrees can be kept up through the winter. The beds should be made from November to February, according to the time the Mushrooms are wanted, and it requires about two months for them to begin bearing. Secure fresh horse manure, free from straw and litter, and mix an equal bulk of loam from an old pasture with it. Keep this under cover, taking care to turn it every day to prevent heating, until the pile is large enough to make a bed the required size. Three to 4 feet wide, 8 inches deep and any length desired are the proper proportions for a bed, but these may be varied. Prepare the mixture of loam and manure, making the bed in layers, and pounding down each with the back of the spade. Leave this to

heat through for a few days, and as soon as the heat subsides to 90 degrees, make holes in the bed about a foot apart each way, and about I inch deep, into which put pieces of the spawn 2 or 3 inches in diameter; fill up the holes with the compost, and at the expiration of a week or ten days the spawn will have thoroughly diffused itself through the bed. Spread a layer of fresh soil over the heap to the depth of 2 inches and cover with 3 or 4 inches of hay, straw or litter. Examine the bed often to see that it does not get dry. Take special care, however, when water is given that it be at a temperature of about 100 degrees. Every other day is a fair interval for picking, care being taken not to disturb any nearby.

From our experience with English, French, and American Spawn, we find there is an important difference between them. If the manure in the bed is in proper condition, the French Spawn will take hold and grow fully as well as the other two, but, if the bed is not in the right state, it will often rot. The American and English Spawns, on the contrary, after starting a little, will remain in a comparatively dormant state for a long time without losing their vitality. It is well to keep these points in mind in ordering Spawn.

Banquet Muskmelon

# MUSKMELON (Cantaloup)

MELON MUSCADE Melon Muscatel

CULTURE.—Select a light, rich, sandy soil, and, after all danger of frosts is over and the ground has become warm and dry, plant in hills 4 to 6 feet apart each way, six to twelve seeds to a hill. When up and all danger of insects has passed, pull out all but three plants. Cultivate until the vines cover the ground, and pinch the ends of the growing shoots to induce early fruiting. Ashes, lime, or even dry road-dust, are excellent to sift over young plants when the dew is on, to prevent the attacks of insects. A few hills for early use may be had by sowing in hotbeds, on pieces of sod or in pots. The seed may also be started out-ofdoors under hand-frames or glasses. It is quite important that proper soil be selected for growing Muskmelons. The hills should have a mixture of well-rotted manure and a fertilizer fairly strong in potash and phosphoric acid dug into them. Or the center of the hill may be removed and a bushel of compost spaded in, covering with a few inches of earth. The melon-patch should be cultivated regularly after each rain and all weeds removed.

All 5 cents per packet, except where quoted otherwise

# **NASTURTIUM**

CAPUCINE

Maraneula

Culture.—Sow as soon as all danger of frost is past, in drills about an inch deep. The tall kinds require fences or poles on which to climb. The seeds are used in flavoring pickles, or as a substitute for capers.

All 5 cents per packet	Oz.	1/4lb.	Lb.
<b>Tall Mixed</b>	\$0 15	\$o 5o	\$1 50
<b>Dwarf Mixed7930</b>	20	60	2 00

# OKRA, or GUMBO Gombaud Quimbombo

CULTURE.—Sow late in the spring, after the ground has become warm, in drills 3 feet apart, where the plants are to remain. Thin out to from 9 to 12 inches. They should be well manured. They may also be raised in pots or a hotbed, and transplanted. For keeping, they should be picked while small and tender. Should be picked usually in less than two days after the blossoms have fallen. Do not leave until the pods have become hard and stringy.

All 5 cents per packet		1/4lb.	Lb.
Long Green. Very productive; moderately long green pods8020	\$о 10	\$o 3o	\$1 oo

<b>Tall Green.</b> Very tall plant; late maturing, long green pods8055	IO	30	I 00

# ONION

OIGNON Cebolla

CULTURE.—Sow in rich, sandy soil, in drills I foot apart, as soon as the ground can be worked in spring, at the rate of 4 to 5 pounds to the acre. Thin to 3 to 4 inches, using the rake and hoe frequently to keep down the weeds. The finest Onions are produced by the new method of sowing the seed in hotbed in February and March and transplanting the seedlings to the open ground. Watch for diseases and insect troubles, taking precautions against them. Diseases are hard to control. It is perhaps best simply to destroy all plants that are attacked.

# **PARSLEY**

Persil Perijil

CULTURE.—Soak the seeds a few hours in lukewarm water, and sow early in spring and until the middle of July, in drills I foot apart. Have the soil thoroughly pulverized, and, after sowing the seed, pat it down lightly with the spade. Thin out the plants to 4 inches. To preserve in winter, transplant to a light cellar or coldframe. No. 8870 should be thinned out while young, and managed in after cultivation the same as carrots and parsnips. The roots are edible either raw or cooked.

# PEAS

Pois Chicharos o Guisanthes

Culture.—A week may be gained in earliness by sowing a quantity in moist sand placed in a box in the cellar, and planting outside when well sprouted. Light, dry soil, not over-rich, suits the Pea. Sow as early as the ground can be worked, and again every 10 days for succession. Peas may be sown in this vicinity as late as August 20. Medium and Late Peas must be planted early; Extra-Earlies may be planted again in August. Sow in single or double rows, from 4 to 6 feet apart, according to the different heights, about an inch apart in the row (except such sorts as we note to sow thinly), and 4 inches deep, 2 pounds to 100 feet of drill. In this climate, the O'Rourke Pea, if planted from the 10th to the last of August, will produce a fair crop for fall picking, when Peas will be most acceptable. Hoe often and keep the ground clean and fine. As Peas suffer in drought, moisture should be conserved by good cultivation. They should also be planted deep, especially the later crops. For this purpose furrow out to 6 inches in depth and cover the seed to only 2 or 3 inches. As the plants grow, fill up the furrow, gradually while cultivating. The tall sorts can be made to bear more freely by pinching in. The dwarf varieties may be grown in beds like bush beans, with rows about the same distance apart. The holes which are sometimes found in The beetles lay their eggs on the young pods, and the

Peas are caused by the Pea weevil (Bruchus pisi). The beetles lay their eggs on the young pods, and the larvæ as soon as hatched make their way through the pods and into the nearest Peas. If the new aphide attacks the Peas, spray the vines every day with clear water of the same temperature as the atmosphere.

Those marked with a star (\*) are wrinkled marrows, and, unless otherwise stated, should be sown thicker than the round Peas and not until the ground has become warm, as they are more liable to rot. They are the finest flavored of all Peas. Those marked thus (†) are large-podded sorts.

We supply packets of Peas at 15 cts. each, postpaid; other quantities not prepaid. Add postage at the zone rates

# PIMENT PEPPER Pimiento

CULTURE.—Sow in hotbeds in March and, when the soil has become warm, set in rows 2 feet apart and 18 inches in the rows. Hoe frequently. The plants may also be forwarded in small pots. The soil should be light, warm, and rich, but not dry. One ounce will produce 1,500 to 2,000 plants. In case of frost give cover—or if the vines bend and the fruit is likely to be soiled, give support.

# POMME DE TERRE POTATOES Patatas

Grown Expressly for Seed. In Barrels

CULTURE.—Three to 4 barrels to the acre, I peck for 100 feet of row. In order to have the best success in growing Potatoes, it is necessary to plant as early as the ground can be made ready. Select a rich soil,

neither dry nor wet. It is wise to select a variety that has done well in the gardener's locality. The farther south the grower lives, the surer he should be that his seed is from the North, for southern-grown seed keeps poorly and sprouts badly. Be sure that all danger of frost is past before planting. Cut the potatoes into chunky pieces of one quarter or so, not thin slices, and plant in rows 3 feet apart, and the sets I foot in the rows and about 4 inches deep. If wood-ashes and plaster can be procured, sow a good dressing over the field after the Potatoes are up. If a very early crop is desired, it will be necessary to sprout the Potatoes before planting. Cut the Potatoes into pieces of any size desirable, and place in a warm, light room for four to six weeks before required for planting in the open ground. During

Carman No. 1 Potato

this time shoots will start out strong and vigorous, so that, as soon as planted they will send out roots and grow much more rapidly than those treated in the ordinary way. Another method is to place the sets in a hotbed two weeks before they are wanted and then lift carefully, so as not to break the sprouts, and set out on fresh horse dung, so that the heat will cause them to start at once. For diseases and pests in general, beginning when the plants are up 6 to 8 inches, spray with a mixture of bordeaux and paris green every two weeks or so. If the Colorado Potato beetle makes its appearance, the vines must be dusted with paris green mixed with about 80 parts of plaster, or, what is better, mix the paris green in water, one small tablespoonful to a pailful, and apply with a small brush or broom. Take care to stir the mixture often, or else the paris green will settle to the bottom. Two or three applications during the season will usually suffice to clean off all the beetles.

These are prices ruling January 1; later on they may be higher and are subject to change without notice.

We ship Potatoes entirely at customer's risk

#### Scarlet Globe-shaped Turnip Radish

# RADISH

RADIS ET RAVE

Rabanos y Rabanitos

Culture.—Sow as soon as the ground is dry in the spring, in rows 8 to 12 inches apart, and 1/2 inch deep, every week or 10 days for a succession up to the middle of June, after which they are but little used unless a cool northern spot can be had, where the ground is shaded during a part of the day. They should be sown in light, rich soil, as a crisp Radish cannot be produced in heavy soils. Sow also in early fall for late crops and winter use. Sow 8 to 10 pounds to the acre; I ounce for 100- to 125-foot row. Radishes should be eaten when quite small; it is a mistake to let them grow too long and too large. This applies particularly to the French Breakfast and small turnip-shaped sorts. Varieties marked with an asterisk (\*) are best suited for market-gardeners.

2 50

# ROQUETTE

CULTURE.—Sow early in spring, and thin out to 8 to 10 inches. If kept well scuffled and watered the tart flavor of the leaves is greatly diminished. This flavor is not pronounced in the small leaves, which are used for salad. The flowers, appearing from May to June, have very much the odor of orangeblossoms. 11590. Pkt. 10 cts., oz. 30 cts., 1/4lb. 85 cts., lb. \$3.

# RHUBARB

CULTURE.—Sow seed in a coldframe, in a fine rich, sandy loam, about the first of March, in drills 4 inches apart. Keep the frames covered during the nights and cold days, so that the soil will not freeze, and in six to eight weeks the plants will be large enough to set in the open ground. Transplant to a rich and deep soil, and set in rows 12 inches apart and 12 inches in the row. The following spring transplant again to a permanent location, setting 4 to 5 feet apart each way. In good soil, Rhubarb is ready to use the second year from seed. When roots are set out, plant them 4 to 5 feet apart each way, and keep weeds down. If roots are used, a crop may be had after one season, which is much better than sowing seed where only a few plants for family use are needed. In the fall, the bed should have a thick dressing of coarse manure, to be spaded Oz. <sup>1</sup>/<sub>4</sub>lb. \$0 25 \$0 75 Each 10 \$0 35 \$3 00 under in spring. Pkt. Victoria.....11640 \$0 05

**Strong ROOTS of Victoria**......11700

Transportation charges extra

#### **SCOLYMUS**

The roots resemble a small parsnip, and will keep through the winter like a turnip. It is cultivated exactly like the carrot, except that it should be grown in rows 3 feet apart and 18 inches in the rows. It is eaten boiled like salsify. 11740. Pkt. 10 cts., oz. 30 cts., 1/4 lb. 85 cts., lb. \$3.

# **SCORZONERA**

Corzonere

Escorzonera

CULTURE.—Cultivate the same as salsify. It is cooked in the same manner, but on account of being somewhat more difficult to raise, is seldom seen in cultivation. Considered by many superior to salsify. It is also called Black Salsify. 11780. Pkt. 10 cts., oz. 40 cts., ½lb. \$1.25, lb. \$4.

# SALSIFY, or VEGETABLE OYSTER

Ostion Vegetal

CULTURE.—Salsify will grow in any good garden soil. Work in some good general chemical fertilizer and scatter some of it along the furrow, covering lightly before dropping in the seed. Sow as early as the ground can be worked in the spring, in drills 12 inches apart, I inch deep, and thin out to 6 inches in the row. Use I ounce to a 60-foot row; 8 to 10 pounds to the acre. Keep the plants free from weeds. A part of the crop may be left in the ground till spring, when it will be found fresh and plump. The roots are cut into pieces 1/2 inch long, boiled until tender, and then served with drawn butter, in which way it is a delicious vegetable. They are also mashed and baked like parsnips, and have a sweet and agreeable flavor. Mashed and fried, the flavor is much like that of the oyster.

Pkt. Oz. 1/4lb. Lb. **\$1** 25 \$4 50 Mammoth Sandwich Island. Large. 11850 I 25 4 50 15 45

#### SORREL

OSEILLE

Acedera

CULTURE.—Sow in spring in drills 18 inches apart, in a rich soil, and keep the flower-stems cut off as they appear. It remains in the ground year after year, and needs to be taken up and divided only once in four or five years. To be cut and cooked precisely like spinach, or it is excellent cooked with it, one-third sorrel to two-thirds spinach. It is also used for soups. Very nice to be eaten after it has become cool. Inasmuch as the hot sun tends to increase its acidity, a northern exposure is preferable.

Mammoth Sandwich Island Salsify

Would you like to have larger and better crops, with less fertilizer and less labor, and at the same time improve the soil for future crops? Mulford's Cultures or Farmogerm will do all this for you. They increase the yield of Peas and Beans, likewise the quality, and cause them to bear earlier and longer. See page 58 for full information.

Giant Lucullus Swiss Chard

# SWISS CHARD, or SILVER BEET

Silver-Leaf. This is a Beet producing leaves only, of a quality superior to those of the ordinary Beet, and excellent as greens. Cultivate about the same as spinach, by sowing the seed in early spring in drills about a foot apart. As it grows, thin out for use, and keep clear of weeds if success is desired. When thinned out to I or I½ feet apart in the rows, pull the leaves as required, leaving the interior head to grow again. Good cultivation will increase the delicacy and tenderness of the leaves. 1690. Pkt. 5 cts., oz. 15 cts., ¼1b. 50 cts., lb. \$1.75.

Giant Lucullus. Large, crinkled leaves; tender and of fine flavor; dark green; pure white ribs. 1700. Pkt. 5 cts., oz. 15 cts., ¼lb. 50 cts., lb. \$1.80.

# SPINACH

EPINARD Espinaca

Culture.—Sow in early spring, I inch deep, in drills a foot apart (IO to I2 pounds to the acre; I ounce to IOO-foot drill), every two weeks for a succession, and, as it grows, thin out for use. Soil should be rich and light. Spade in plenty of compost or well-rotted manure, with a good high-grade fertilizer, putting also some of the latter under the row, covering lightly before sowing the seed. For fall use, sow in August, and for winter crop in September. Cover that which is left out over winter with straw or leaves after the weather

becomes quite cold. Keep clear of weeds. Sow the seeds of New Zealand in hills 2 feet apart each way, three or four seeds in a hill.

TOMATO TOMATO Tomate

Culture.—Sow in a hotbed in early spring, about 1/8 inch deep, or the seed may be sown in shallow boxes and placed in a window when one does not wish to have the trouble of making a hotbed. One ounce will produce 1,500 to 2,000 plants. Transplant to the open ground when all danger of frost is past, setting the plants 3 to 4 feet apart each way. Soil should not be wet, but should have a good supply of moisture. It should be deep, with plenty of well-rotted manure. Avoid any nitrogenous food, and dress the plants only once or twice lightly with manure water or nitrate of soda. Fruit may be had several weeks earlier by sowing seed quite early and transplanting into small pots. When setting out plants, put them several inches lower in the ground than they stood in the pot, in order that they will not dry out. Tomatoes that have not ripened at the end of the season may be taken from the vines and placed in empty coldframes, or wrapped in tissue paper and carefully packed in flat boxes, where a large proportion of them will ripen from time to time, frequently until Christmas.

Early Snowball Turnips

# TURNIP

NAVET Nabo

Culture.—For early Turnips, sow as soon as the ground opens in spring. Nos. 13854 to 13930 should be sown from any time in July to first of August, but the other kinds, for winter use, may be sown from the middle of July to the end of August. Turnips are generally sown broadcast but much larger crops are obtained (particularly of the Rutabagas) by cultivating in drills 18 inches apart, and thinning to 6 inches in the drill. Sow in drills, I pound to the acre; I ounce to 150 feet of drill; broadcast, 2 to 3 pounds to the acre.

Lawns like this can be produced by sowing Thorburn's Lawn Grass Seed

# ABOUT LAWNS AND LAWN GRASS SEED

Formation of Lawns from Seed

There is nothing more attractive than a well-kept lawn.

Many things are to be considered in connection with the making and proper care of lawns. A good lawn

cannot be made in one season, success coming only through intelligent care for a period of years.

The ground should be thoroughly drained and well prepared. The soil ought not to be too rich, as a rapid growth is not wanted in the grasses of a lawn; but the surface should be as much alike in quality as possible and thoroughly pulverized. After sowing, the ground should be rolled and cross-rolled in order to press the seed firmly into the soil, and ten days or so thereafter a light application of Thorburn's Lawn Fertilizer mixed with an equal quantity of good loam or sand, will serve to stimulate the growth of the young grasses. The proper time to sow grass seed depends, of course, upon the latitude. In the central and eastern states from March 15 to the middle of May is the best time; but in favorable seasons the sowing may be done up to July 1. Seed may also be sown in the fall, from the latter part of August to the end of September. The sowing should be done when the ground is moist, or before an expected rain, and a subsequent rolling is always advisable. As to weeds in newly-made lawns, it may not be generally known that many weed seeds actually lie dormant in the ground for six or seven years and will germinate and make their appearance when the soil is turned up. The annual wild grasses, such as crab grass or summer grass, must be pulled up by the roots before they ripen their seed in the fall.

**Rolling.** As soon as the frost is out of the ground in the spring, the land should be gone over with a heavy roller. Winter frosts loosen the soil, and rolling is necessary to compress it again. Roll frequently.

Mowing. All turf-forming grasses are improved, both in vigor of root-growth and in fineness of texture, by frequent mowings. It is impossible to say just how often the grass should be mown, as that depends upon the rate at which it grows. Too close cutting should be guarded against, however, especially during the hot summer months, when the roots require some top-growth to protect them from the burning sun.

A good top-growth is also necessary to protect the roots from severe winter frosts.

To Grass a Bank or a Terrace. For each square rod, take a pound of Terrace Lawn Grass Seed and mix it thoroughly with 6 cubic feet of good, dry garden loam; place in a tub, and add liquid manure, diluted with about two-thirds of water, so as to bring the whole to the consistency of mortar. The slope must be made perfectly smooth, and then well watered, after which the paste should be applied, making it as even and thin as possible.

It is a good plan to sow on good land, in any out-of-the-way place, strips for sod to be used for patching poor parts of the lawn, or for grass borders, etc. The best mixture of seed for this purpose is *Cynosurus cristatus* (Crested Dog's-tail), Kentucky Blue Grass, and Fancy Red-Top.

This Lawn was sown with Thorburn's Lawn Grass Seed Mixture for Shady Spots

# LAWN GRASS SEED MIXTURES

Prices of all Lawn Grasses include free delivery in the United States by mail, express, or freight, at our option

#### THE THORBURN LAWN GRASS SEED

Many of the finest lawns in America were produced from this mixture. It is composed exclusively of permanent grasses that will make a finer and thicker turf the older they become, and yet give a rich greensward in three or four weeks from the time of sowing. Sow at the rate of 80 to 100 pounds to the acre. One pound of our Lawn Grass Seed will sow a plot of 400 to 500 square feet.

# Thorburn's Lawn-Restoring Grass Seed

A mixture of grasses peculiarly suited to take firm hold and grow quickly on hard, worn-out, or burned spots. The best time to resow such places is very early in the spring, but seed may also be sown with good results in the fall, from the first of September to the first of October. Some Lawn-restoring Grass Seed should also be sown before every summer rain on thin places.

# **GRASS SEED MIXTURES FOR MEADOWS AND PASTURES**

It is a well-ascertained fact that thicker and more prolonged growth is produced by a mixture of many sorts of grasses than by only one or two. For every different kind and condition of soil there are grasses that are especially suitable. Some sorts do best on high ground and in dry weather; others prefer plenty of moisture. Some mature so early and others so late that from the beginning of spring until winter sets in there is no time when one species or another is not at its best. Grass Seed may be sown either early in spring or in fall, from the first of September to the middle of October; in this latitude the best time to sow meadow Grass Seed is during the late summer and early fall, that being the natural seeding time for grass. This will, of course, not give very much of a crop the following year; the grass will be fine and thick, but rather short, and not a heavy yield. The best meadows are seeded alone, without any "nurse" crop, while if seeded with rye, that crop being the stronger and quicker grower, will monopolize the ground so that it will be another year before much of a crop of grass can be had.

For over a hundred years our house has made a specialty of grasses. We were probably the first to introduce to this country, for commercial distribution, the many valuable natural and cultivated foreign species that now take such an important part in our agricultural economy. The formation of permanent pastures and meadows has, for many years, been a subject of careful study with us, and the following formulæ for seeding grass-lands have received universal recognition. The quantities given are the minimum, and may often be increased to advantage.

**Frices** subject to market fluctuations during the season without notice

The various grasses used in the above mixtures are fully described on the following pages.

We are always glad to make up Special Mixtures, and are pleased to answer inquiries as to the best grasses for different purposes and for sowing on various soils under varying climatic conditions.

# **GRASS SEEDS**

We desire to call particular attention to the fact that Grass Seeds are sold in the trade by sample, and each sort is divided into three or four grades of quality, according to purity, germination and weight. The price of the best grade is often double that of the ordinary. The Grass Seeds here offered by us are in every case the VERY HIGHEST GRADE.

Not less than one pound of any one sort sold

Prices subject to market fluctuations during the season without notice

The weight per bushel, where given, is average actual weight

AGROSTIS TENUIS (Rhode Island Bent Grass). Resembles Red-Top (A. palustris, described below), but is of dwarfer habit, with shorter and narrower leaves. It makes a beautiful, close, fine turf, and is one of the very best grasses for lawns in mixture with other sorts. It adapts itself to almost any soil, rich and moist, or dry, sandy and sterile. For lawns 60 pounds of seed to the acre is recommended. (16 pounds to the bushel.) We find it is impossible to procure pure seed of the Rhode Island Bent this year. All samples show an admixture of other grasses.

AGROSTIS MARITIMA or AGROSTIS STO-LONIFERA, TRUE (Creeping Bent, or South German Fiorin). The only true Creeping Bent Grass. The distinctive feature of this species is, as the name implies, its compact, creeping, rooting stems. It is of rapid growth and spreading habit, and the stoloniferous roots which it sends down into the soil from a strong, enduring turf that is positively improved by constant trampling. The other varieties of Agrostis are distinguished from this sort by their flattened, parallel surface roots. Being of fine texture, it is most valuable for lawns and putting-greens. If sown alone, 60 pounds to the acre should be used. As the true seed of Creeping Bent Grass comes from Germany only, it is impossible to secure any until conditions abroad are more settled.

AGROSTIS PALUSTRIS or AGROSTIS ALBA (Red-Top; Herd's Grass). Unhulled. A very hardy, native perennial grass, succeeding best on moist land. It accommodates itself to a variety of soils, however, even to dry situations, and stands our hot climate admirably. It is, perhaps, the most permanent grass we have, and it enters largely into the composition of our best natural pastures. It remains green for the greater part of the year, and its long, trailing stems form a very close, matting turf that is not affected by trampling. Sow 75 pounds to the acre.

Lb.........\$0 28 | 25 lbs.......\$6 25 10 lbs...... 2 60 | 100 lbs.......24 00

**RED-TOP GRASS, FANCY HEAVY.** Extra recleaned. Absolutely clean and free from chaff. Sow about 50 pounds to the acre.

Lb.....\$0 50 | 25 lbs.....\$11 00 10 lbs.....4 50 | 100 lbs.....40 00

ALOPECURUS PRATENSIS (Meadow Foxtail). One of the best permanent pasture grasses for rich, moist soil. Its chief characteristics are its earliness and its faculty of standing high summer heats without burning. It prefers moist, low grounds, but it accepts drier situations, and makes an earlier spring verdure than any other variety. Sow only in connection with other grasses, 3 to 4 pounds to the acre; if sown alone, 25 pounds to the acre.

Lb....\$0 70 | 25 lbs....\$16 00 10 lbs....6 75 | 100 lbs....60 00

**ANTHOXANTHUM ODORATUM** (True Perennial Sweet Vernal Grass). For a mixture with pas-

ANTHOXANTHUM ODORATUM, continued ture grasses, it is valuable on account of its vernal growth, and also for continuing to throw up root foliage until late in the autumn. For meadows, its chief merit is the fragrant odor which the leaves emit when partially dried, thus sweetening hay. It is a vegetable condiment, rather than a grass of much nutritive value. From 2 to 3 pounds to the acre when mixed with other grasses.

Lb......\$0 90 | 10 lbs.......\$8 00

AVENA ELATIOR (Tall Meadow Oat Grass). Most valuable for pasture on account of its early and luxuriant growth; it produces an abundant supply of foliage, which is relished by cattle early and late. For hay it may be cut twice a year, and for green soiling it may be cut four or five times in favorable seasons. It is very hardy, and withstands extreme drought and heat and cold. It is very valuable for our southern states, where it is extensively cultivated for winter grazing and for hay. Sow 50 pounds to the acre.

Lb.....\$0 70 | 25 lbs.....\$16 00 10 lbs......6 75 | 100 lbs......60 00

valuable grass for our southern states, both for pasture and lawns. It is of dwarf habit, with long, creeping stems rooting at the joints and covering the ground with a matting of fine turf which no amount of trampling will impair. It is also useful for binding drifting sand and for steep embankments subject to wash. When established it is difficult to eradicate, and is therefore unsuitable for temporary pastures. It requires heat and moisture to start it. As it cannot endure frost, it is of no value north of Virginia. It thrives in the poorest and sandiest soil, and resists extreme drought and intense tropical heat. It should be sown at the rate of 15 pounds to the acre. Crop uncertain.

BLUE GRASS, Canada. See Poa compressa.
" " English. See Festuca pratensis.
" Kentucky. See Poa pratensis.

BROMUS INERMIS (Awnless or Smooth Brome Grass). An erect perennial, 3 to 5 feet high; native of Hungary. The nutritive quality of its hay, however, is generally inferior to that of our standard native sorts, so that we should recommend it only for dry, arid soils where the better and more delicate grasses will not grow. It is strongly stoloniferous, its creeping rootstocks spreading rapidly under ground and giving out new plants. It is on this account undesirable for temporary meadows, being difficult to eradicate when once established. Sow 35 to 40 pounds to the acre.

Lb.....\$0 70 | 25 lbs.....\$16 00 10 lbs......6 75 | 100 lbs......60 00

BROMUS PRATENSIS (Meadow Brome Grass). A hardy perennial, 2 to 3½ feet high, much used in mixtures for meadows both for mowing and pasture. It is not recommended to be sown alone except in poor soil, on dry, stony hillsides, where better grass will not grow. It withstands extreme

#### **GRASS SEEDS, continued**

bromus pratensis, continued cold and drought, and, if cut before flowering, it makes good hay. If left to grow older, it becomes very tough. Sow 30 pounds to the acre. Crop uncertain.

A stoloniferous perennial, forming a smooth, compact and lasting turf. It thrives best on rich, moist land, but it can accommodate itself to almost any soil. Its roots penetrate deeply into the ground, which enables it to stand severe droughts. It makes a good bottom grass and is therefore valuable in mixtures for lawns and putting-greens. It thrives well in the shade. The color is the same as that of the Kentucky Blue Grass, and it is, therefore, excellent in mixture with that sort. If sown alone, 30 pounds to the acre is none too much, but it is recommended only in mixture with other sorts.

Lb.........\$0 65 | 25 lbs......\$14 00 10 lbs....... 55 00

**DACTYLIS GLOMERATA** (Orchard Grass; Cocksfoot). Extra re-cleaned selected stock. One of foot). Extra re-cleaned selected stock. the grasses most employed in permanent meadows, either for pasture or for mowing. It is very hardy and succeeds well anywhere in the United States. It is very productive and makes excellent hay. If cut before it flowers it is less hard and the pith of the stem is soft and sweet. It blossoms about the same time as Red Clover, and is, therefore, desirable in mixture with that plant. Stock of all kinds are very fond of it, either dry or green, and it endures constant cropping better than any other grass. After being mown, it grows up quickly and yields a heavier aftermath than any other variety. It can stand considerable shade and is recommended as a pasture grass for woodlands. Its tendency to grow in tussocks is diminished if it is sown with other grasses, and also by heavy rolling in the spring, but it is quite unsuitable for lawns. Sow about 75 pounds to the acre.

Lb......\$0 60 | 25 lbs.....\$13 00 10 lbs...... 5 00

DOG'S-TAIL, CRESTED. See Cynosurus cristatus.

reeds best in moist, alluvial, and strong, clayey soils. It is very productive and of long duration, and is especially valuable for permanent pasture. Stock of all kinds eat it readily, and its nutritive value is very great. On rich, moist lands it yields a large amount of hay of excellent quality. It is not suitable for lawns. Sow 40 pounds to the acre. Lb........\$0 90 | 25 lbs......\$20 50 10 lbs.......\$8 00

of America and Europe. In our northwestern states there are many varieties of it, some of which grows 2 to 3 feet high. It prefers dry uplands and thrives in poor, shallow, gravelly soils, where other grasses would fail. It is very hardy, resisting extreme heat and cold. Though of dwarf growth, it grows thickly, yielding a large amount of nutritious herbage. In grass mixtures, for pastures on high and dry lands, it is especially valuable. Though a "bunch grass," it may be included in lawn mixtures as well as in fair-green mixtures on account of its fine foliage and dwarf dense growth. Sow 35 pounds to the acre.

growth. Sow 35 pounds to the acre.

Lb.......\$0 50 | 25 lbs......\$11 00

10 lbs.......4 50 | 100 lbs......40 00

FESTUCA PRATENSIS (Meadow Fescue; English Blue Grass). One of the grasses most used in permanent or temporary meadows for mowing or for pasture. It succeeds best in cold, moist, light soils, in well-drained meadows and in low valleys rich in organic matter. It should not be grown at all on warm, dry land. It does not reach its full development until the second or third years, when it far exceeds most other sorts in the quantity of its produce and nutritive matter. After being mown, it grows again very quickly. The forage, either green or dried, is very nourishing and much relished by cattle, especially when cut young. Sow 40 pounds to the acre. Crop uncertain.

**FESTUCA** (Chewing's New Zealand Fescue). A variety of Hard Fescue of dwarf habit, grown with great success on poor, light, as well as heavier soils, forming a good sward where no other grass would succeed; it stands drought well and is good in mixtures for permanent pasture, golf links, or lawns. Sow 15 pounds to the acre.

Lb......\$0 70 | 25 lbs.....\$16 00 10 lbs......6 75 | 100 lbs......60 00

**FESTUCA TENUIFOLIA** (*Slender Fescue*). This is really a variety of *Festuca ovina*, with much finer leaves. It will grow on very dry and inferior soils, and its dwarf habit of growth and fineness of leaf render it not unsuitable for dry slopes on lawns and golf-links. It stands grazing well, is very hardy, and lasts long, and may therefore be recommended for permanent pasture on high and dry situations. Sow 30 pounds to the acre. Crop uncertain owing to the conditions abroad—will give price on application, if practicable.

FOXTAIL. See Alopecurus pratensis.

HUNGARIAN GRASS. See Panicum germanicum.

JOHNSON GRASS. See Sorghum Halepense,
page 58.

Short-seeded. Although called a perennial Rye Grass). Short-seeded. Although called a perennial, it seldom lasts more than three or four years. It is the most valuable grass in Great Britain, both for pasture and for meadows, occupying there the same relative position of importance that Timothy holds here. The cool, moist climate of England seems to suit it best, yet it succeeds very well in our middle and eastern states, and adapts itself to a great diversity of soils. The seed is large and heavy, and produces a strong, verdant growth in four or five weeks after sowing. It cures into hay having a sweet flavor, and is much relished by cattle and horses. Its nutritive value, especially in mixture with Red Clover, is very great. It is excellent in mixtures for quick effects in lawns or golf-links. Sow 60 pounds to the acre.

LOLIUM ITALICUM (*Italian Rye Grass*). Though lasting two or three years, under very favorable circumstances, it is practically an annual. Like the Perennial Rye Grass, it is a remarkably rapid grower, and has, in addition, the advantage of standing extremes in temperature, remaining green throughout the winter, and retaining its freshness in the hottest summer months and during pro-

#### GRASS SEEDS, continued

LOLIUM ITALICUM, continued longed drought. When sown very thickly or in mixture with other sorts, it makes a good, dense turf, and it has been used with much satisfaction on lawns as far south as Jacksonville. On rich, moist soils, it is exceedingly productive and may be cut in four or five weeks after sowing, and every six weeks after that until frost. For temporary meadows, on good soils, it is a most valuable grass. Sow 50 pounds to the acre. Lb.....\$0 28 | 25 lbs......\$5 50 10 lbs......20 00

OAT GRASS. See Avena elatior.

ORCHARD GRASS. See Dactylis glomerata.

PANICUM GERMANICUM (Hungarian Grass). One of the most valuable annual soiling plants. It grows on any ordinary soil; withstands drought well. As it is of very rapid growth, being ready for cutting within sixty days, it may be sown in this latitude as late as the middle of July for hay, or in the middle of August for green fodder. It should be cut just before blooming, when it makes a tender and nutritious hay. Sow 75 pounds to the acre.

Lb......\$0 22 | 25 lbs......\$4 50 10 lbs.......16 00

PAPSALUM DILATATUM (Australian Water. Grass). A somewhat leafy perennial, growing in clumps. Valuable as a pasture grass for the South; endures summer heat and drought very well and is especially desirable for furnishing late summer and autumn feed, during which period it makes its principal growth. Sow lightly on the surface in warm weather. The seed should barely be covered with soil. Sow from 8 to 10 pounds to the acre, with 5 pounds of Hungarian Grass as a temporary protection. Price on application, if obtainable.

HLEUM PRATENSE (Timothy). A native of Europe, but long ago naturalized in America, where it ranks as by far the most important of PHLEUM PRATENSE (Timothy). hay grasses. On moist, loamy or clayey soil it produces a larger hay crop than any other grass. It is not as well suited for light, sandy soils, though preferring a moist, temperate climate, it withstands drought and extreme heat and cold. Its hay is very nourishing and can be preserved for a long time. It should be cut when flowering, as if left later the hay becomes hard and coarse. It is often sown with Red-Top Grass and Red Clover, and the nutritive value of the hay is greatly increased by this mixture. If sown alone, at least 25 pounds to the acre should be used; with Red-Top Grass and Red Clover, 15 pounds of Timothy, 12 pounds of Red-Top Grass (Fancy) and 3 pounds of Red Clover; or with Red Clover only, 20 pounds of Timothy and 5 pounds of Clover. The seed weighs 45 pounds to the bushel. Several grades are always on the market, differing in purity and vitality, but the seed we offer is of the very highest quality and extra clean. It is always most economical to buy the highest grade, known as "Fancy."

Lb......\$0 25 | 25 lbs.......\$5 50 10 lbs......20 00

POA COMPRESSA (Canada Blue Grass). Highest grade. A very hardy perennial grass, with creeping root-stocks. It grows on the poorest and driest soils, sandy, gravelly or clayey, standing extremes of wetness or drought, and keeping green until the severe frosts of winter. It is especially valuPOA COMPRESSA, continued

able for dairy pastures, cows feeding on it yield-ing the richest milk from which the finest butter is made. It is distinguished from the Kentucky Blue Grass by its flattened, wiry stems and by its decidedly bluer color. Sow 60 pounds to the acre.

Lb.....\$0 38 | 25 lbs.....\$8 00 10 lbs.....3 00

POA PRATENSIS (Kentucky Blue Grass; June Grass). Highest grade. One of the most widely distributed and valuable native grasses. It combines more points of excellence than any other sort. It is a true perennial, lasting indefinitely and improving every year. Its densely creeping root stocks, spreading habit and smooth, even growth, fine texture, and rich green color render it one of the very best grasses for lawns. It forms a close turf, starts very early in the spring, and lasts till frost. It succeeds in almost any soil—dry, rocky, sandy or gravelly—and stands long-continued dry weather and hot suns. It takes, however, two or three years to become well established, and should, therefore, be sown only in connection with other If the soil is especially suitable, it will eventually crowd these out, and make the finest possible sward. It is one of our most valuable pasture grasses, very productive and nutritious. Sow 50 pounds to the acre.

25 lbs.........\$11 oo 10 lbs..... 4 50 | 100 lbs..... 40 00

POA TRIVIALIS (Rough-stalked Meadow Grass). A spreading, thickly matted, stoloniferous-rooted species, forming a fine turf, and adapted for shaded portions of lawns. It thrives on rich, moist soil and in sheltered situations, but not on dry land. Valuable for forming bottom grass in mixtures for permanent pastures. Sow 20 pounds to the acre. Lb........\$0 95 | 25 lbs......\$21 00 10 lbs...... 80 00

RHODES GRASS (Chloris gayana). A recent acquisition from Africa, grows 4 to 6 feet high. The Florida Experiment Station reports on it as follows: "Excellent for hay as well as for grazing purposes; keeps green until cut down by severe frost and then starts growing again as soon as warm weather returns. Yields enormously and can be cut three to five times." Sow 5 pounds to the acre. Present price: Lb.....\$1 oo | 100 lbs.....\$90 oo

SUDAN GRASS. This recently introduced grass belongs to the Sorghum family, and, according to the reports of the United States Department of Agriculture is a very valuable grass for hay, especially in sections subject to drought, making good yields nearly everywhere; it grows 4 to 9 feet high, according to cultivation, yielding 2 to 5 tons of excellent hay per acre, with as high as 9 tons under irrigation; should not be sown until the soil has become warm, about corn-planting time or a little earlier. Sow broadcast at the rate of 25 pounds to the acre. Lb......\$0 25 | 100 lbs.....\$20 00

# **CLOVERS**

We quote present prices on Clovers as near as it is possible to offer them at, as we go to press. We shall be very glad to quote prevailing prices on all of them from time to time, and we solicit inquiries. It is understood, of course, that all are subject to market fluctuations without notice.

ALFALFA, or LUCERNE (Medicago sativa). Requires deep, rich, well-drained soil. The tap-root descends often to a depth of 10 to 15 feet in loose soil. It is consequently, capable of resisting great droughts. It should be sown alone (about same time as oats are sown in this section) in thoroughly prepared deeply plowed soil, at the rate of 20 to 25 pounds to the acre. It may also be sown as late as August and up to the middle of September in more southerly localities. The crop should be cut when the plant is coming into bloom. In suitable soil it is perennial, and several crops may be cut every year. American seed. Market variable. Price on application.

ALSIKE, or HYBRID CLOVER (Trifolium hybridum). A perennial, I to 3 feet high, succeeding best in cold, stiff soils, and in marshy lands which are too wet for other species. It grows well in the far North and in high altitudes. A good honey plant for bees. Sow 15 pounds to the acre. Market variable. Price on application.

BERSEEM, or EGYPTIAN CLOVER (Trifolium alexandrinum). Suitable for a rotating crop on irrigated lands. It is very succulent and much relished by stock. Its value as a soil-renovator is very high. Market variable. Price on application.

**BOKHARA CLOVER** (*Melilotus alba*). Valuable sort for soiling and for ensilage and bees. Grows from 3 to 5 feet high; sown in rich soil it may be cut three times; lasts for years if cut before flowering. Sow 15 pounds to the acre.

Lb......\$0 50 | 25 lbs......\$11 50 10 lbs......4 75 | 100 lbs......45 00

RED CLOVER, MEDIUM (Trifolium pratense). One of the most valuable farm crops of the eastern states for pasture, hay, or for turning under for green manure. Sow in the spring, 15 pounds to the acre. Market price.

JAPAN CLOVER (Lespedeza striata). An annual valuable only in the South, where it thrives in any soil in the driest season. It makes fair hay; eaten readily by stock when green. Valuable for plowing under. Sow in spring broadcast, 30 pounds to the acre.

Lb......\$0 40 | 25 lbs......\$9 00 10 lbs......3 75 | 100 lbs......35 00

vulneraria). A deep-rooted, herbaceous hardy perennial, valuable for dry, sandy and inferior soils, upon which Red Clover will not thrive. Eaten with avidity by sheep, cattle and horses; useful in mixture for dry soils. Sow 20 pounds to the acre. Price on application.

crimson, or scarlet clover (Trifolium incarnatum). Erect annual, I to 2 feet high, with bright scarlet flowers. A native of southern Europe; largely grown in our southern states for improving the soil by turning under. Will not endure severe frost, and cannot be depended upon to stand the winter north of New Jersey. It is a valuable crop for pasturage or green manure. For hay, cut when in full bloom. Cattle are very fond of it. Sow 20 pounds to the acre.

Lb......\$0 25 | 25 lbs......\$5 25 10 lbs......20 00

WHITE CLOVER (Trifolium repens). White Clover is of dwarf habit, spreads rapidly and is very hardy. It is valuable in permanent pastures, being sweet and nutritious and forms a close herbage which stays green throughout the year. Sow in spring, 8 to 10 pounds to the acre. At the present time White Clover is extremely scarce and high—price on application.

N. B. All prices are subject to market fluctuations without notice

# Forage, Economical and Miscellaneous Seeds

Except where noted, these seeds are not sold in packets. From 15 cts. to 25 cts. worth is the smallest quantity put up

ALL SUBJECT TO CHANGE IN PRICE

australian salt bush (Atriplex semibaccata). Thrives in soils on which nothing else will grow, and it is highly recommended for alkali soils and all regions subject to periodical drought. It is very nutritious, and good for all kinds of live-stock. Two or three pounds of seed are sufficient for an acre. The seed may be sown in beds, and the seedlings planted out when 2 inches high, 3 feet apart. Grows strong and vigorously in the driest seasons. Lb. 70 cts.

**BEANS** (60 lbs. to the bushel)—

Velvet Bean (Dolichos multiflorus). Used in the South as a forage plant, and as a fertilizer plant for turning under. Stock readily eat the vines and leaves, and the Beans, when ground, with or without the pod, are used in place of oats or corn, or mixed with them. Plant in rows 4 feet apart and I foot in the row, 2 or 3 Beans in a place, as soon as danger of frost is past. The vines are strong and vigorous in growth, rapidly covering the ground, and bearing immense quantities of Beans. Qt. 25 cts., bus. \$6.

Soybean (Glycine hispida). Thrives well in hot

Soybean (Glycine hispida). Thrives well in hot and dry weather. Plant at the rate of ½ to ¾ bushel to the acre, in drills 2½ or 3 feet apart, and cultivate same as field corn. It does not make good hay, but is good as ensilage or green fodder.

BEANS, Soybean, continued

Hollybrook Early. A vigorous, quick-growing variety. Pk. \$2.50, bus. \$8.50.

Mammoth Yellow. The largest growing Soybean, valuable for green fodder and for improving the soil. Pk. \$2.25, bus. \$8.

BEGGAR-WEED (Florida or Giant Beggar-Weed; Desmodium tortuosum). An erect, leguminous annual, growing from 3 to 8 feet high, with abundant foliage; valuable as forage or for soil renovation in subtropical regions; it also makes hay of a fine quality. It should be sown at the rate of 10 pounds to the acre, after the ground is warm and moist. The seed should be but very lightly covered. If for hay, it should be cut just as it begins to bloom. Lb. 60 cts., 100 lbs. \$50.

BROOM CORN (Sorghum vulgare). (12 qts. to the acre.) Broom Corn succeeds in a good, deep soil, fresh but not damp, and it is very sensitive to cold.

Improved Dwarf. Lb. 12 cts., 100 lbs. \$10. Long-Brush Evergreen. Lb. 12 cts., 100 lbs. \$10. California Golden Long-Brush. Grows from 12 to 14 feet high. Lb. 15 cts., 100 lbs. \$12.

CAPER TREE (Capparis inermus). Pkt. 25 cts., oz. \$1.

CASTOR BEAN (Ricinus). The plant from which castor-oil is made. Lb. 30 cts., 100 lbs. \$25.

COTTON (Gossypium), Sea Island. Lb. 25 cts., 100 lbs. \$20.

Upland Big Boll, Trice Variety. Lb. 25 cts., 100 lbs. \$20.

**COWPEAS** (Vigna catjang). Specially adapted to warm countries; extensively grown in our southern states, also valuable in this latitude as a fodder-plant. The chief value of Cowpeas, however, is as a green crop to plow under. The seed should not be sown till the ground has become well warmed. Sow I bushel to the acre, in drills; 2 or 21/2 bushels to the acre is sown broadcast.

**Black.** Standard variety; early and very prolific. Price variable. Present quotation, pk. \$2.50,

bus. \$8.50.

A little later than the Black; prolific in Clay. both Peas and growth of vine. Price variable. Present quotation, pk. \$2.50, bus. \$8.50.

New Era. Upright-growing, quick to mature and very prolific of peas. Price variable. Present quotation, pk. \$2.50, bus. \$8.50.

Whippoorwill. A favorite sort; makes a good

growth of vine and very good for improving the land. Price variable. Present quotation, pk. \$2.50, bus. \$8.50.

MER. (Sometimes advertised as "Speltz," though this name is incorrect, the true Speltz EMMER. being a different article.) It is grown quite extensively in the Northwest, having been brought there from Russia, where it is considered a valuable cereal on account of its hardiness and drought-resisting qualities. Lb. 20 cts., 100 lbs. \$12.

**ESPARSETTE.** See Onobrychis sativa.

**FETERITA.** A new forage plant, similar to Kaffir Corn, but much earlier, and is a great drought resister. Sow 8 to 10 pounds to the acre in drills. Produces large crops of both grain and forage. Lb. 15 cts., 100 lbs. \$12.

FURZE (Ulex europæus). Also known as Whin and Gorse. A perennial leguminous shrub. The crushed sprigs of one year's growth of this shrub furnish an excellent green fodder in winter. It grows well on barren hillsides and in sandy soil. Sheep are fond of it. Sow 25 pounds to the acre. Oz. 15 cts., lb. \$1.50.

**JUTE** (Corchorus). Annual. Thrives in any good corn ground. Sow in drills, about 8 inches apart, 4 pounds to the acre. Requires no cultivation, as it will outstrip in growth all weeds. May also be sown broadcast, 6 or 7 pounds to the acre. Oz. 15 cts., lb. 75 cts.

KAFFIR CORN. See Sorghum, page 58.

**LENTILS.** Extra-large yellow. The variety commonly cultivated. Sow in spring as soon as ground can be worked, on light soil in drills. Market price on application.

LOTUS corniculatus (Bird's-foot Trefoil). Perennial; used in pastures. Cattle and sheep eat it readily, and it is said to be quite nutritious. It grows on the lightest and most sterile soils, and can withstand severe droughts. Is excellent for sowing in mixture for dry pastures. Lb. \$1.

villosus, or major (Greater Bird's-foot Trefoil).

Lb. \$1.

LUPINE, White (Large Flat Seed). One of the best plants known for green manure, as it gathers large quantities of nitrogen from the air. It may be sown from April to July and plowed under when in flower. The seed, when burned, is excellent manure for orange and olive trees. Lb. 35 cts., 100 lbs. \$30.

MILLETS. See Miscellaneous Cereals, page 55.

**ONOBRYCHIS** sativa (French, Sainfoin; Esparsette). A perennial leguminous plant, belonging to the same family as clover and lucerne. It is a valuable plant for growing on poor land and barren hillsides. When once well established, it lasts for many years. If to be used for hay, cut just before the flowering period. Sow in spring, covering the seeds quite deeply, at the rate of 80 to 100 pounds to the acre. Lb. 45 cts., 100 lbs. \$40.

**OSAGE ORANGE** (Maclura aurantiaca). Useful for hedges. Lb. \$2.

**PEANUTS, Spanish.** Used in the South as a hay and grain ration; the tops also make good forage, either green or cured. Nuts are smaller but better flavored than other sorts. Price variable. Present quotation, lb. 35 cts., 100 lbs. \$30.

PEARL MILLET (Penicillaria spicata). A valuable fodder-plant for the South; is enormously productive. Sow the seed in drills 18 inches apart and 8 to 10 pounds to the acre. Lb. 35 cts., 100 lbs. \$30.

Valuable for northern PEAS, Canada Field. climates, for cattle-feeding, especially for milch This pea also makes fine ensilage and for plowing under as a green manure has no equal. It is sown broadcast in the spring and harrowed in 2½ to 3 bushels to the acre. If sown with oats, use about 1½ bushels to the acre. Price variable. Present quotation, qt. 35 cts., bus. \$9.

PENICILLARIA spicata. See Pearl Millet.

**POPPY, Opium** ( $Papaver\ somniferum$ ). The seed furnishes an agreeable sweet oil, used for the table, also for painting and for illuminating. May be sown in spring, either broadcast or in drills, covering thinly. Also cultivated for opium. Oz. 15 cts.

RAPE, Dwarf Essex English (Brassica Napus). Largely grown in the northern United States and in Canada. It is excellent for sheep-pasture and also for soiling. It may be sown in May, and will be ready for pasturing in July and August; or, it may be sown in June or July, and yet furnish a large amount of pasture or fodder. In drills, sow 5 pounds to the acre; sown broadcast, 10 pounds to the acre. Price variable. Present quotation, lb. 25 cts., 100 lbs. \$20.

REANA luxurians (Teosinte). Short crop. A valuable fodder-plant from Central America, in growth resembling Indian corn. Well adapted to our southern states. Oz. 15 cts., lb. \$1. to our southern states.

RICE SEED. For sowing. Best Carolina. Lb. 25 cts., 100 lbs. \$20.

**SAINFOIN.** See Onobrychis, above.

SALT BUSH. See Australian Salt Bush, page 56.

**SORGHUM.** If sown in drills 25 pounds are required to the acre; for dry fodder, 2 bushels to the acre.

Early Amber Sugar-Cane. Ripens wherever Indian corn matures. Grows 10 to 12 feet high. Lb. 15 cts., 100 lbs. \$10.

**Brown Dhoura.** Lb. 15 cts., 100 lbs. \$12.

Halepense (Johnson Grass). One of the most valuable Southern fodder plants. On rich soils it may be cut three or four times in a single season, and it is claimed that hay made from it is equal in value to Timothy. Sow in August and September, 35 to 40 pounds to the acre. Price on application.

Holcus saccharatus (Sugar Millet). Rich in saccharine matter, and a large amount of nutritive fodder can be obtained from it. Lb. 25c.,

Jerusalem Corn (White Dhoura). Lb. 20 cts., 100 lbs. \$18.

Red Kaffir Corn, or Sorghum. Non-saccharine. The plant is low, stalky, perfectly erect. The whole stalk, as well as the blades, cures into excellent fodder, and in all stages it is available for green feed. Lb. 15 cts., 100 lbs. \$10.

White Kaffir Corn. Lb. 15 cts., 100 lbs. \$10. Early Orange Sugar-Cane. Ripens about 10 days after Early Amber, and is said to produce a larger crop. Lb. 15 cts., 100 lbs. \$10.

Shallu. A non-saccharine Sorghum from India, also known as Egyptian wheat. Requires more room to develop than ordinary Sorghum, and consequently needs less seed to sow an acre. Lb. 25 cts., 100 lbs. \$20.

SORGHUM, continued

White Milo Maize. Lb. 15 cts., 100 lbs. \$10. White Dhoura. See Jerusalem Corn.

Yellow Branching (Yellow Milo Maize). Nonsaccharine; useful for the large amount of foliage, green feed, or cured fodder that it furnishes, and for its grain. Lb. 15 cts., 100 lbs. \$10.

**SPURRY** (Spergula arvensis). Annual. Grows well on poor, dry, sandy soil; may be sown every month from March to August. Excellent pasture for cattle and sheep; also of much value as a fertilizer for light soil. Sow 15 pounds to the acre. Lb. 25 cts., 100 lbs. \$20.

Giant Spurry. Lb. 25 cts., 100 lbs. \$20.

SUNFLOWER, Large Russian. Lb. 25 cts.

TEOSINTE. See Reana luxurians, page 57.

TOBACCO SEED. See page 44.

ULEX europæus. See Furze, page 57.

**VELVET BEAN.** See page 56.

**VETCHES, Spring Tares** (Vicia sativa). broadcast at rate of 60 to 100 pounds to the acre, like wheat or barley, and sometimes mixed with oats for soiling. Used in France and with oats for soiling. Canada as a substitute for peas. Price variable.

Present quotation, lb. 20 cts., 100 lbs. \$15. Sand, Winter or Hairy Vetch (Vicia villosa). Thrives on poor, arid, sandy soils. It may be sown either in fall or spring, mixed with rye for a support. Grows 3 to 4 feet high, and can be cut as soon as the bloom appears and again for seed. Perfectly hardy. Sow from 30 to 50 pounds to the acre. Price on application.

#### Mulford Cultures

For inoculating all legume crops with nitrogen-fixing bacteria to increase the crop and improve the soil.

5-acre size \$5, 1-acre size \$1.50, 1/4-acre size 50 cts., small size 25 cts. The small size only supplied in 4 varieties for Garden Peas, Garden Beans, Lima Beans, and Sweet Peas. Always specify on your order what crop you want to inoculate, a different variety being used for each legume.

# Farmogerm

The Original and Genuine Seed Inoculant. A preparation of high-bred, nitrogen-gathering bacteria in sealed bottles, ready to use, with water added, according to directions.

Price per acre bottle, \$2; 5-acre bottle \$8. When ordering state for what crop Farmogerm is wanted.

Also, in garden size, enough for 1,000 square feet, or a 200 foot row, at 50 cts. per bottle for Peas, Beans, Sweet Peas, and White Clover, each crop requiring a different bottle. We secure cultures, fresh from the laboratory, hence it takes two or three days to fill

# TREE AND SHRUB SEEDS

To preserve seeds of Conifers and other Evergreen Trees, it is best to keep them in perfectly dry sand until the time of sowing. For this latitude the seeds should be sown thinly, as early in the spring as the ground can be worked, in beds of fine, sandy loam. Cover to the depth of about the thickness of the seed, and press the beds gently with the back of the spade to firm the earth around the seeds. Great care must be taken not to give too much water, as the young plants damp off very easily. Water with a very fine rose, but never so that the ground becomes soggy. Some shade must be used to protect the young plants from the hot sun and winds, and to keep the birds from destroying them. Seeds of the rarer sorts may be sown in coldframes or boxes; if in coldframes the sashes should be shaded and the frames raised at the corners 3 or 4 inches to allow the air to circulate freely. Keep the young plants well weeded, and allow them to remain one to two years before transplanting.

The propagation of Deciduous Trees from seed is less difficult than that of Evergreen species. Acorns, Hickorynuts, Chestnuts, and Walnuts should be planted in autumn, or kept during the winter in earth or moss. They shrivel up by too long exposure to the air, and many of them lose their vitality. Those seeds with hard shells, like the Locust, Gymnocladus, etc., should be planted in autumn or placed in boxes with sand, and exposed to frost before planting. They may not germinate till the second year after planting, and if they are received too late in the spring to expose them to the action of the frost, they may be put into a vessel of hot water for an hour or so before planting. American Elm, Silver Maple and a few other sorts ripen their seeds early in summer, and, if gathered and planted soon after they fall from the tree, will make fine plants the same season. The seeds of other Deciduous Trees and Shrubs should be planted from the middle of April to the middle of May, in drills about 2 feet apart, and covered about 1/2 inch deep, according to size.

As the season advances, many sorts become worthless from various causes, or are sold out, and cannot be replaced until the new crop is ready next season. On account of labor trouble it has been almost impossible to collect Tree Seeds the past season. We are offering only the varieties we expect to receive.

# **FLOWER SEEDS**

#### PRACTICAL DIRECTIONS FOR CULTURE, TREATMENT, ETC.

Hardy Annuals (hA).—Sow in April or May, according to the latitude, in shallow boxes or pots placed in a warm window, a hotbed, or, if possible, in a greenhouse. A second sowing ought to be made from two to four weeks after for succession, as well as to provide against failure the first time. For sowing seeds in there is nothing better than shallow boxes from 2 to 3 inches deep, and of any convenient size. The most suitable soil for all the smaller kinds is a very fine, rich, sandy loam. That from old hotbeds is excellent, or sods from an old pasture piled up and allowed to rot for two or three years and then mixed with a little old stable manure and sand. After the seeds are up care must be taken to give them plenty of air and moisture, yet not too much water, or they will "damp off." When the young plants are well out of the seed-leaf they must be transplanted to new boxes. If pots 2 inches or more in diameter can be had, set out from three to a dozen or more of the young seedlings along the edges of the pot, so that as soon as the ground is warm enough they may be easily turned out and planted singly, as by that time they will have made good roots. When pots cannot be had, boxes, tin cans, etc., may be substituted.

A common mistake in sowing flower, as well as other seeds, is covering too deeply. The exception to

this is the Sweet Pea which is seldom planted deep enough. As a general rule, cover only to the depth of the thickness of the seeds; or, with medium-sized seeds, like Balsams, Zinnias, etc., half an inch or so is none too much. Such fine seeds as Portulacas need only to be pressed into the soil with a piece of board or the palm of the hand. Always press the earth down firmly after sowing all flower seeds, else there is danger of their drying up before the roots can get firm hold of the soil. Seeds of the hardier Annuals may be sown where they are to grow; but, as a rule, it is preferable to transplant, as the plants are generally stronger and stand the drought better. During very dry weather, and when the seedlings are first set out, they should be watered frequently. Provide some support for all such Annuals as require it.

The weeds should be kept down and the ground loosened often, so that the plants will receive the full benefit of the rains and dews, which they will not if the ground is allowed to become hard and baked. Seeds of Biennials and some Hardy Annuals may be sown in July and August in the open, and in Sep-

tember in boxes and placed in coldframes. They will make strong plants by spring, and flower early. Do not put on the sashes until heavy rains and frosts begin, and then always remove during the day whenever the temperature is above freezing in winter.

Owing to the presence in most soils of weed seeds, it is well to mark where seeds are sown in the open, so that the weeds (which are apt to germinate first) can be destroyed before they crowd out and smother

the Flower Seeds as they spring up.

Hardy Biennials (hB) and Hardy Perennials (hP).—These require the same treatment as the Hardy Annuals. In addition to the above, both Hardy Biennials and Perennials may be sown in the open border from July to September. The seeds of many Perennials require several months, some even as long as two years, before they germinate. It is a good plan, at the commencement of frost, to cover the plants lightly with straw, leaves or any dry litter, in order to afford some protection from the extreme severity of the winter. As soon as the frost is out of the ground in the spring, remove the covering and loosen the surface around the plants, which, when large enough, may be transplanted to the flower-garden where they are to remain.

**Half-Hardy Annuals** (**hhA**).—These may be sown in shallow boxes, pots or a hotbed, as directed for Hardy Annuals. They may be sown thus at any time after the middle of April, as the hotbed will be sufficient protection; but it is best to cover the glass with a mat or straw at night until danger of frost is past. In the day give all the air possible. After the end of May sow in the border, like Hardy Annuals.

Half-Hardy Biennials (hhB) and Half-Hardy Perennials (hhP) require the same treatment. Though plants and their blooms are greatly forwarded by sowing the seeds early in boxes under cover, it may be stated that nearly all kinds of Hardy and Half-hardy Flower Seeds may be sown in the open border in a warm and sunny spot as soon as the soil has become dry and warm; so that those who have no glass frames or greenhouses need not be without flowers. They can have them, but it will be later.

Tender Annuals, Biennials and Perennials.—The best method to obtain an early bloom of the Tender Annuals (tA) and to insure strength to the plants, is to sow the seeds in boxes or pots in March, placing them in a warm greenhouse or plunging in a moderate hotbed, carefully protecting them from the cold, shading from the midday sun, and watering with a fine rose. The seed should be sown in a very light, sandy compost, and the pots well drained by placing broken pots or bits of sod in the bottom. The finer seeds must not be covered more than an eighth of an inch deep, and the soil pressed down closely over them. Water frequently, particularly if the house or hotbed is very warm. As soon as the plants are out of the seed-leaf, transplant them into shallow boxes or small pots, and when they have acquired sufficient strength transplant into the flower-beds; not, however, before the middle of May.

Greenhouse Seeds (g) should be sown as directed for Tender Annuals, in pans, pots or shallow boxes, and be kept in the house, carefully watched, slightly watered occasionally and sheltered from the hot sun

till strong enough to transplant. Most varieties may be sown at any season of the year.

The smaller seeds of Greenhouse Plants are sometimes difficult to make germinate unless great care be taken in the mode of sowing. Hence the supposition arises that the seed itself is not good, whereas the fault is not in the seed, but in the treatment. Fine seeds of this description should be sown in leaf-mold or peat, with some fine sand added to it; press firmly down in the seed-pan or pot, and make perfectly level at the top so that the mold may not afterward sink materially with watering. Sow the seed very thinly and cover very lightly with a little compost or with silver sand. Success is more certain if a pane of glass is placed over the pan or box till the plants have appeared, when it should be removed. As soon as the young plants have two leaves they should be transplanted into similar composts in another pan or box. After transplanting they should be kept in a shady part of the greenhouse for a few days and watered very sparingly.

King Asters (see page 65)

# **ASTER**

One of the very best Annuals for cut-flowers

The Aster has long been one of our most popular garden flowers, not only because of its beautiful blooms but because it is one of our hardiest annuals and will thrive in any soil, from a light sand to a heavy clay. It produces a profusion of bloom, and by a careful selection of early- and late-flowering varieties, its blooming season may be extended over several months. As a cut-flower it rivals the chrysanthemum in lasting properties and lovely coloring.

When planting Aster seeds, do not cover with more than ½inch of soil. If the soil is too poor, add some well-rotted stable-manure, or if that is not procurable, pulverized sheep-manure is an excellent substitute. All manures must be thoroughly mixed with the soil in order to be most beneficial, and they should be well-rotted and not applied too liberally, or there is danger of their inducing Aster diseases. Small quantities of slaked lime or fresh wood-ashes, stirred into the surface of the Aster-bed, form good tonics for the plants and keep diseases and insects from the roots.

Seed sown in the open ground in May will produce plants that will bloom finely in September and October. When the plants have three or four leaves, transplant, 12 to 18 inches apart each way, into well-prepared beds. Asters do not object to partial shade, and in such places are less subject to attacks of insects. After transplanting, stir the soil as often and as deeply as possible. Never allow a crust to form, as it prevents the air from entering the soil and allows the moisture to escape rapidly. If watering is necessary, give the plants a good soaking—do not merely sprinkle them. If a mulch of lawn clippings or other material is placed on the beds when the flower-buds have formed, it will help to retain the moisture in the soil and prevent the opening flowers from being soiled by a storm.

For July and August flowers, sow in March or April in the coldframe, spent hotbed, or in pots and boxes indoors. Water thoroughly when necessary, and allow surface to become dry before watering again. Transplant as directed above. Aster Seeds run from 3,000 to 3,500 in 1/4 ounce.

# **SWEET PEAS**

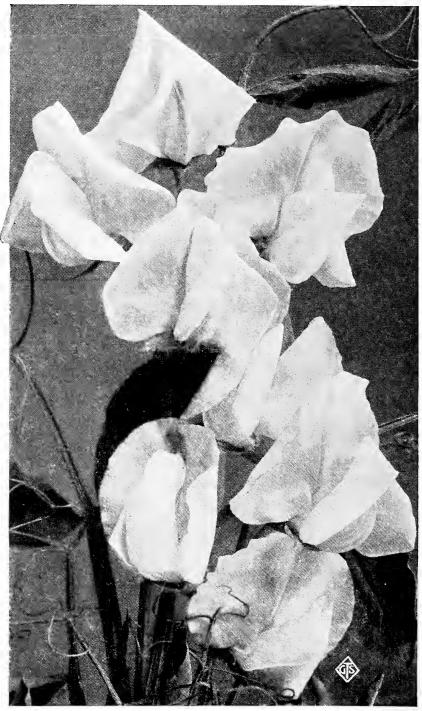

Lathyrus odoratus

N. B.—Intending purchasers are strongly advised to order as soon as possible after receipt of catalogue

Through the skill of specialists the Sweet Pea has become much larger and lovelier than before it became so popular. There are flowers of quite distinct shapes, some of which are a great improvement upon the Sweet Pea of the old type. For garden decoration it is now grown in clumps and in separate colors. The plants are more robust, dwarf and branching, and bloom more freely, some varieties showing three or four blooms on a stem.

A deep, rich, moist soil is best suited to Sweet Peas, hence a trench should be dug 1 1/2 feet deep and filled with very best loam mixed with bone meal or well-rotted manure. The vines are usually grown in double rows, with a wire trellis or a row of brush between. For each double row make the drills about 12 inches deep, and 9 to 10 inches apart. Sow plentifully, covering about 2 inches deep, and, by degrees, as the vines grow up, fill the trenches with soil, and thin out to about 2 or 3 inches apart. Spring sowings should be made just as early as the ground can be prepared, white-seeded varieties should not be sown until the ground is fairly warm. The earliest flowers are from seed sown in fall, preferably in a dry situation, and 6 to 8 inches deep, giving them level culture. Sweet Peas should not be grown on the same soil year after year. If the location cannot be changed, the soil to a depth and width of a foot or so should be removed and replaced by soil from another part of the garden or grounds. If the soil is in good, rich condition, bone meal is the best fertilizer.

We do not sell less than 1 oz.,  $\frac{1}{4}$ lb. or  $\frac{1}{2}$ lb. at the prices quoted per oz.,  $\frac{1}{4}$ lb.,  $\frac{1}{2}$ lb. and lb. respectively. This applies to all types and to the mixtures.

Thorburn's Spencer Sweet Peas, King White

# New Giant, Early-Flowering, Long-Season Spencer Sweet Peas

This new race of Sweet Peas is expected eventually to take the place of all other early and late varieties, as they bloom from four to six weeks earlier than the late-blooming Spencers sown at the same time and continue blooming for four months. They are vigorous growers with immense waved flowers borne on long, strong stems in threes and fours, adaptable to our warm summers, and free-flowering. We strongly recommend a trial of these new creations.

Early Melody. This is a deeper shade of pink pkt. of than Early Songbird, on white ground. It seeds might be described as rose-pink on white ground; very pleasing; mostly four well-waved biossoms to each stem; free-flowering. 54544
Early Morning Star. Deep orange-scarlet or flame-color in standard, with rich orange-pink wings. Keeps its color well and does not burn badly. Flowers are large and waved, borne in threes and fours abundantly. Under artificial light its coloring is exquisite........54555
Early Snowflake. The blossoms are very large and of the best waved form, resembling the noted White Spencer; a free bloomer, with

weet I cas

<b>Early Song-Bird.</b> Soft blush pink shade; large, Pkt. fine flowers, borne on long stems in threes and seed fours. When in full growth it appears as though every stem has four blossoms, and of	of is

## SELECTED LIST OF FLOWER SEEDS

We have unquestionably the largest assortment of Flower Seeds in America, and our strains are far superior to those commonly sold, often under fancy names and at fictitious prices. We avoid extravagant descriptions, meant only to effect sales.

There are many minute plants from the finer seeds killed by drenching with water while very young. In the first stage of their existence plants require moisture in a minute quantity, often repeated, and not

in such large quantities as to saturate the soil in which they are growing.

FLOWER SEEDS DELIVERED FREE BY MAIL ON RECEIPT OF THE STATED PRICE Not less than \(^1\)/40z. or 1 oz. sold at the prices quoted per \(^1\)/40z. or 1 oz. respectively. Price, on application, per ounce or pound for those not quoted.

#### Explanation of Signs Employed in This List

The Asterisk (\*) designates ornamental-leaved plants. This mark (‡) prefixed indicates the climbers.

A represents Annual—lasting but one year. B "Biennial—lasting two years." S represents Shrubs—plants of bushy habit. greenhouse plants. В Вu " Perennial—lasting three or more years.  $\mathbf{P}$ bulbous plants. Evergreen—retains foliage the entire year.  $\mathbf{E}$ 

As a large number of Biennials and Perennials, if sown early, flower the first season from seed, this

distinguishing mark (†) is affixed to such.

The hardiness is denoted by the following abbreviations, but it should be understood that this is intended to apply to the climate of the Middle Atlantic States. Farther north or south, these designations apply only in a comparative way.

The letter h represents hardy—plants for open border; hh represents half-hardy—plants that require be forwarded in pots or frames; t represents tender—requiring protection.

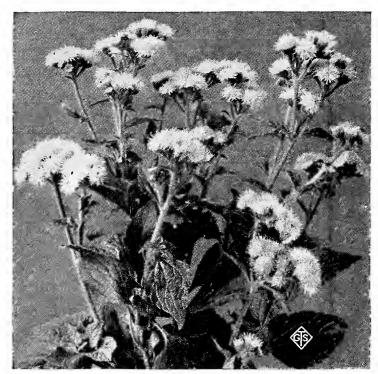

Customers will find it more convenient to order by number. If ordered from any catalogue other than this (1920) kindly state from which year's catalogue the numbers are taken. This will facilitate the filling of orders and will insure prompt shipment.

Many of our Flower Seeds are grown in Europe, and some sorts may not be received until later in the season than usual. At the time of going to press we expect to receive all the varieties we quote.

If permission is given us to substitute, we shall use our best judgment in sending equally good sorts for those originally ordered, or a memorandum will be kept of any items not sent and the seeds will be forwarded as soon as they arrive.

Campanula Medium

CAMPANULA (Canterbury Bells). Popular and beautiful are Campanulas. Although the Canterbury Bells are biennials, they may also be treated as annuals, and will flower the first year from seed, if sown early in the spring. For effect in the border, plant them in clumps of separate colors, and they are beautiful when massed. The perennial varieties, treated as perennials, will flower most profusely by midsummer. The tall and stately growing kinds will be found of great value for the border, while will be found of great value for the border, while the dwarf sorts make charming rock and edging plants. All the varieties like a rich, sandy soil with good drainage. carpatica. hP. •
CARNATION (Dianthus Caryophyllus). The
splendid Carnation of the florist is a very inter-
esting plant to grow from seed, and it is not over-exacting. Sown under glass in early spring,
or later in the open ground, the plants will
flower finely the second summer. For largest,
richest flowers we recommend culture in pots of
rich soil. With many they are also garden
favorites, and, grown in this way, flowers of
good quality may be enjoyed all summer if
given plenty of water, good soil, and a mulch
about their roots. With the tall varieties, staking
fectly hardy outdoors but when two or three
and tying are necessary. Young plants are perfectly hardy outdoors, but when two or three years old they are injured by winter cold, so
that sowings should be made every year. The
more expensive sorts produce the finest flowers.
The prices we quote, although seemingly high, are
most reasonable for strains such as we offer.
MARGARET CARNATIONS are an extra-vig-
orous race, especially adapted for outdoor cul-
ture. They are very neat in habit, and remarkable for their rich profusion of flowers, produced
five months from sowing. Grown as annuals
from seed every spring, they are most satis-
factory. Pkt.

PERENNIAL VARIETIES. This section includes the large-flowered sorts, and the pretty, hardy Pompons that make bright masses of color in our gardens long after heavy frosts have cut down other flowers. We wish to make quite clear the distinction between this class and the Annual Chrysanthemums described above, so that, as has sometimes happened heretofore, customers may not order seed of the summer-blooming garden

Annual Chrysanthemum	
chrysanthemum, perennial, continued varieties, expecting them to yield the gran show flowers of late fall. For ordinary culture and room decoration, plants pinched back to form a number of branches, and holding from five to ten flowers, are satisfactory. Average height of show kinds, 3 ft.	re to m ge

<b>CINERARIA.</b> One of the most useful and ornamental of greenhouse plants, with flowers of the richest and most brilliant colors and shades, and of the finest texture. It is rather a difficular to grow if its requirements are not under	ne id lt

plant to grow if its requirements are not understood. The mistake generally made is in growing it in a warm house instead of a cool one. The seed should be started in the greenhouse. For winter blooming sow in April and May in shallow boxes, in fine soil; drop the seed in shallow drills, cover, and press the earth rather firmly with a piece of board or the bottom of a pot. Set the box where it will get the morning sun, water moderately and carefully. Average height, 2 ft.

CORNFLOWER See Centaurea Cyanus.
COSMOS. One of the notable fall flowers. A
strong, tall-growing annual, with bold flowers
of exquisite daintiness and airiness heightened
in effect by their foliage setting of feathery green. It is most effective when planted in
broad masses, or long background borders
against evergreens or fences. We offer only the
choice, large-flowering strains. To make sure of flowering early, Cosmos should be started indoors
and transplanted into dry, sandy, or poor soil, in
a sunny situation.
<b>EARLY FLOWERING.</b> If seed is started early in the house or frame, this fine strain will pro-
duce flowers a month earlier than Mammoth
Perfection. Pkt.

Cyclamen Papilio

CYCLAMEN. These bulbous greenhouse plants are all very beautiful and are unapproached among winter-flowering plants for duration of bloom, variety of shades, and wealth of coloring. They are among the best plants recommended for house culture, as they thrive well and bloom profusely in the average temperature of the living-room. Sow the seed in small boxes or seed-pans in a compost of well-rotted manure, leaf-mold and sand, in the early winter months. Cover lightly with moss, which should be kept moist and should be removed after the seed germinates. Prick out into small pots when the young plants have two leaves. If grown steadily without any check, they will flower in from ten to twelve months. Average height 9 in.

beauty of its blue tints, which are as numerous as they are charming, no other plant can equal the Delphinium. The brilliant flowers are strongly effective in beds or masses, in borders, shrubberies, or in combination with white lilies. Improvements are continually being made in the size of the flowers, as well as in the length and fullness of the spikes. Some of the species flower both early and late; the season for all can be prolonged by cutting away withered flowerstems. All varieties are easily cultivated and adaptable to many conditions, but in a soil deeply dug and well enriched with fine old manure, their blooms are the finest. Setting them 1½ to 2 feet each way is not too much for the taller sorts.

"

cinth - flowered, so called from their long, narrow flowerspikes. They bloom best in a rather cool, moist soil. Sow seed in the open border, either in spring or fall, preferably the latter, so that germination may take place very early in the spring. As the seedlings grow, thin them to stand 6 to 18 inches apart, according to variety. The varieties are seldom kept separate, as they are quite as pretty and convenient for cutting when sown in mixture. Some of these are really hardy biennials, but, because they bloom the first season, we treat them as hardy annuals. The shades of color cover a very wide Ajacis, Dwarf Rocket. Finest colors: very beautiful for bedding.

California Poppy. The state flower of California. This much-esteemed hardy annual is very bright and rich in its pure tints of yellow, orange, etc. The plants average about a foot in height, with silvery foliage, and produce their large, poppy-like flowers from early spring until frost. They are most effective when grown in beds of considerable size, over which the seed may be sown broadcast thinly, and lightly raked in. These sowings may be made early in spring or late in autumn for earlier germination, blooming the next spring. Useful as a pot-plant and for cut-flowers.

<b>THORBURNII.</b> Coppery orange; the effect	
of a plant in bloom is simply gorgeous; the

Hollyhocks are very permanent and hardy	
the first winter it is	

the first winter, it is advisable to sow seed every year of these splendid, hardy perennials, as the flowers on young, vigorous plants are much finer than on old ones. Sowings should be made in April or May, and not later than June, to flower the next year. In final transplanting give each seedling a foot or more space each way for development. They succeed best in an ordinary deep, rich soil. They make a glorious show in the garden with their splendid spires of flowers.

compactly about 3 to 5 feet in height, and bloom continuously and profusely during the summer. They are excellent for grouping or massing in separate colors, and they suit themselves to almost any position in the border, making a good cut-flower, and of easy culture, requiring ordinary moist soil, deep as possible, but well drained, with plenty of old stable manure, in any open, sunny position. Sow seeds in April in their permanent places, transplanting or thinning as may be required.  arboreus. Yellow Tree Lupine	African Marigold

### **NASTURTIUM**

We do not sell less than 1 ounce of any one kind by weight

A marvelous range of new colors has been developed in this favorite flower which, for three or four months of the season, makes a better display than almost any other plant. No other hardy annual will produce such a lavish profusion of flowers for so long a time with the same small outlay of time and labor. The maximum of bloom is produced on thin soils, and never flags through the hottest weather. In soils too rich, leaves predominate, and the plants are apt to rot off in wet weather, especially if standing too close.

All 30 cts. per oz., except where quoted otherwise

Thorburn's Superb Pansies

# **PANSY** (Viola tricolor; Heartsease)

OUR STRAINS HAVE NEVER BEEN EXCELLED

The Pansy is a plant that we all delight to grow in plentiful supply for flowers all the year. For very early outdoor bedding the seed is sown from August to October, in a coldframe, or in rich, moist garden beds, from which the plants can be transferred to a coldframe, setting them 2 to 3 inches apart each way before severe winter weather begins. In spring three-fourths of them can be lifted out for bedding and the rest left to bloom in the frame. For winter blooming in a frame set the plants about twice as far apart, and thin out half of them in the spring. Cover the blooming plants with sashes, adding a covering of matting or straw in very cold weather. In mild weather remove the mats and tilt the sashes to admit light, heat, and fresh air. In outdoor beds, raised a few inches above the ground, with a mulch of dry leaves and some brush to hold them in place, Pansies will often winter nicely and bloom until midsummer, when a relay of young, vigorous plants should be ready to replace them. Spring sowings should be made early so as to secure good flowers during the early rains. Seed sown in a cool, moist place in June and July, and well tended, will give good flowering plants for fall. If they come into bloom in the heat of the summer, the flowers may be small at first, but, as the weather becomes cooler they will increase in size and beauty, and make a glorious show in the garden. Through summer heat the flowers are finer in a somewhat shaded place, but in almost any situation good Pansy seed will give fine flowers in spring and fall. Early fall sowings give the finest flowers in spring, and a bed of Pansies is one of the most beautiful sights a garden can show. The higher-priced sorts produce the largest flowers and the most brilliant colors. This should be borne in mind when ordering.

PETUNIA HYBRIDA. hhA. Once fairly started, Petunias grow almost as easily as weeds and furnish a glorious succession of bloom from early summer until frost. The large-flowered strains are very beautiful and of almost endless variety. Seed of the double and Giant-flowered Petunias is made expensive by the great amount of labor involved in hand-fertilization, and it is well to handle seed and tiny seedlings with some care. Sow in hotbed, coldframes, or in boxes of fine soil in the sunny windows of a warm room in April or May, and transplant about I foot apart in garden beds. Seed of the double varieties has not so much vitality as that of single sorts and needs a little more care in watering to be sure of germination. We have no better plants than the Petunias for beds and masses, borders, window-boxes, baskets and vases. They will grow in almost any soil and bloom profusely through long droughts. The newer varieties are of brilliant colors. The highest priced sorts produce the finest and handsomest flowers, and those we offer are from the most carefully selected strains, saved at great expense.

Apparently similar sorts offered at lower prices are not to be compared with those we offer. Average height, 1 ½ ft.

SINGLE LARGE-FLOWERING. These b	nave
flowers 4 or more inches across. Our strains	are

sorts	25

DOUBLE LARGE-FLOWERING. will produce flowers large, fragrant, elegantly formed and beautiful either for house, garden or conservatory. Only a small proportion of the double strains bear double flowers. The reason of this is the fact that the seed must be selected from single flowers, the double ones not producing seed. The single flowers must be pollinated with pollen from the double ones. Cuttings may be made from double-flowered plants and inserted in light, sandy loam for rooting, thus increasing the percentage of double-flowering plants Pkt.

PHLOX DRUMMONDII (Flame Flow-

er). The hardy annual Phloxes are dazzling in effect, particularly so when sown in masses or ribbon beds of contrasting colors. Few flowers are so easy to grow from seed, so pretty and compact in habit, so quick to bloom, or give such a brilliant display of color for so little cost and care. There are few desirable colors beyond their range, and if given good soil and plenty of water, they will furnish a long supply of delicate flowers. For pot culture dwarf varieties are valuable and as an undergrowth for tall, barestemmed plants they are also valuable. first sowings should be made as soon as the frost is out of the ground in spring, later ones in May, either where the plants are to bloom, or in a seed-bed, as the Phlox transplants readily. In transplanting set the taller kinds about a foot apart; if planted too thickly they suffer from mildew. Cutting away the flowers and seed-

PINKS (Dianthus). In this large and greatly varied genus are some of our most beautiful and best-loved flowers, unsurpassed for color and fragrance. They are hardy biennials that bloom finely the first season, remaining green all winter and blooming the next year also, if lightly protected. Old plants flower the earliest, but as young ones give the largest, finest flowers, sowings are made every year. Seed can be sown under glass in the spring, or in an open, sheltered bed. The seedlings are easily transplanted and should stand 8 to 12 inches apart; dwarf ones about 6 inches. If especially large, brilliant flowers are desired, a bed of well-mixed turfy loam, leaf-mold and well-decayed manure should be prepared for them. Average height,

poppy (Papaver). Before tulips are fairly gone our gardens begin to be gay with Poppies. Few flowers have the same grace of stem, airiness of poise, and delicacy of tissue. For beds and borders, with a background of green, there is nothing finer. Some sorts are admirable for naturalizing in open wooded grounds; others, like the Shirley, are beautiful for cutting. A sandy loam suits Poppies best, and, as their strong tap-roots are difficult to transplant, it is well to sow the seed where the plants are to bloom. Sowings made in fall and at intervals in spring will provide a long succession of flowers. Sow thinly, covering very lightly, and thin the plants to stand about a foot apart. The best plants are those grown from early sowings while the soil is cool and moist.

Salpiglossis grandiflora

SALVIA SPLENDENS, continued	Pkt.
<b>Bonfire.</b> Our well-known, compact Salvia	
—the freest blooming of all, seemingly on fire all the time, with dense, flaming scarlet	
spikes. 2 ½ ft. ¼ oz. \$1.50, oz. \$5 77400	10
Early Dwarf Zurich. Grows only 12 to 15	
inches high, with many fine, erect, slender	
spikes to each plant, borne well above its	
handsome foliage. Color brilliant scarlet;	
splendid bedding variety, earliest of all 77410	2.5
Lord Fauntleroy. Only 18 inches high;	25
very compact with the brilliant scarlet	
very compact, with the brilliant scarlet flower-spikes standing clear above the	
foliage. Fine for bedding in masses or for	
borders around beds of taller sorts; also	
fine for pots. Very early flowering. 77420	25
Scarlet Dragon. A superb bedding plant	
for summer and autumn; flowers are nearly twice the size of the old Scarlet	
Sage; when full grown the plants form	
bushes about 3 feet in height, and the same	
in diameter, and are a mass of bloom. <b>77430</b>	25
<b>Silverspot.</b> Rich, green leaves elegantly	v
spotted with yellow. The intense, bright	
scarlet flowers are large and lavishly	
borne; neat and compact. 2½ ft77440	25
SANVITALIA procumbens flpl. Beautiful	
dwarf-growing, hardy annual for beds or	
borders; bright yellow, double flowers; blooms all summer. 6 in	10
	10

Snapdragon

habit, fine leaves, beautiful and fragrant flowers, a long season of bloom and adaptability to many conditions of culture. They are unsurpassed for bedding, edging, pot-culture and for cutting. For fine early flowers sow under glass in March or April, transplanting the seedlings when an inch high into other pots or boxes, or into fine soil spread over some discarded hotbed. In May transfer to garden beds of deep, rich soil, setting the plants a foot apart. Transplanting several times in the early stages of growth tends to make them more dwarf and compact. For later flowers sowings may be made in the open ground in May. If plants that begin to bloom late are carefully potted in fall they will flower finely all winter in a house that is tolerably cool and moist. Average height, I to I ½ ft.

### **ORNAMENTAL GRASSES**

The Ornamental Grasses are very attractive to use in mixed flower-beds or borders, and for grouping by themselves give fine effects. Many of them, if cut before they are entirely ripe, will be found very useful, when dried, in the formation of winter bouquets, in connection with the "Everlastings."

Put up in packets	s and ounces only
*AGROSTIS (Cloud Grass). hA. Very fine for vases and bouquets. Pkt.  nebulosa. Very delicate and graceful. 18 in	GYMNOTHRIX. Curious and ornamental, single specimens are of striking effect. 3 ft. Pkt.  latifolia. hP. Very ornamental; bears nodding spikes
*ARUNDO (Great Reed). hP. Well adapted for large clumps; stately and ornamental. 10 ft.  Donax foliis variegatis. Green leaves, Pkt. striped with white	the tall-growing, ornamental Grasses. Bears magnificent plumes; needs protection in winter. 4 to 6 ft.  argenteum. Long, silvery white plumes; Pkt.
AVENA sterilis (Animated Oats). hA. Drooping, curious and very graceful. 2 ft. 82680 5  BRIZA (Quaking Grass). hA. Well-known, graceful species; very fine for bouquets. I to I ½ ft.	splendid. ½oz. 25c83160 10  "roseum. Rose - colored plumes83170 10  HORDEUM jubatum (Squirrel-tail Grass).

### GLADIOLI

All extra-selected, large corms, no second size

If to be sent by mail, add postage at zone rates. Weight per 10, 1 lb.; 100, 8 lbs.

Gladioli are very easily grown. Any good soil suits them. Plant the corms as soon as all danger from frost is past, about 3 inches deep and 7 or 8 inches apart. By planting at intervals up to July I, these fine flowers can be had in bloom all through the summer and fall, the later flowers being the best. About the end of October, when the leaves begin to wither, the corms should be taken up, dried in the open air, and then stored in a dry place, free from frost, for planting next spring. It is a mistake to plant Gladioli without some suitable subject to hide the surrounding soil; to do this we suggest planting lower-growing plants, such as Saponaria calabrica, Nigella Miss Jekyll, Violas, and Dwarf Godetias. Those marked with an asterisk (\*) are used extensively for forcing.

# NOVELTIES NEW NAMED GLADIOLI

white AMERICA. White. The unopened buds are flesh-white in color, opening clear white, with slight marks of blue in throat. 30 cts. each, \$2.50 for 10, \$20 per 100.

ENCHANTRESS. Blush-white. Blush-white, slightly flaked with lake-pink toward the margins; throat encircled on the lower petals with carmine-lake blotch; a dusting of golden bronze zoning; the blotch is unique. 30 cts. each, \$2.50 for 10, \$20 per 100.

Thorburn's Extra-Fine Mixed Hybrid Gladioli

**EVELYN KIRKLAND.** Rosy pink. The flowers are of strong substance and a beautiful shade of rosy pink, darker at the edges, fading to shell-pink at the center, with brilliant scarlet blotches on the lower petals, the entire flower showing a glistening sparkling lustre. Very tall spike; extra fine form and color. 50 cts. each, \$4 for 10, \$35 per 100.

**SULPHUR KING.** Yellow. This is by all odds the most valuable yellow variety ever introduced. It produces a very long spike of the clearest sulphur-yellow flowers yet seen in Gladioli. 30 cts. each, \$2.50 for 10, \$20 per 100.

**CONTRAST.** Scarlet. Flowers of great substance and a beautiful compact spike of perfect form, color intense scarlet, with large, distinct pure white center, which is neither tinted nor mottled. One of the most striking and beautiful Gladioli ever introduced. 40 cts. each, \$3.50 for 10, \$30 per 100.

### CANNAS, Dwarf, Large-Flowering French

Not less than 5 of a kind at 10 rate, 25 at 100 rate. If wanted by mail, add 15 cts. per 10 for postage

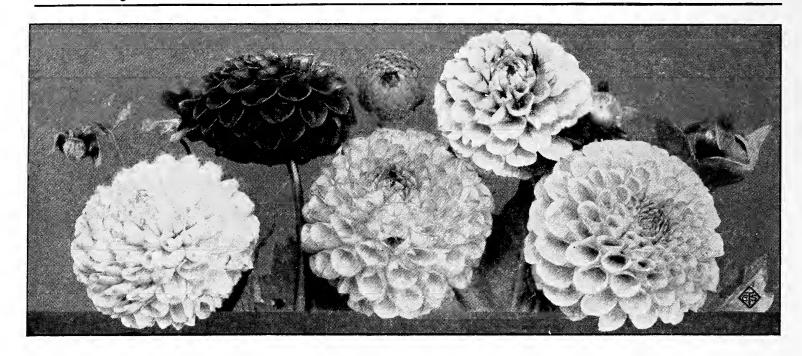

Cannas do well in almost any kind of soil, but they well repay liberal treatment. For the best results they should be planted in good loam that has been well mixed with an abundant supply of well-rotted stable or other manure. The beds should be spaded 2 feet deep or more, and the soil well pulverized. Water should be applied abundantly at all times, but good drainage is essential.

should be applied abundantly at all times, but good drainage is essential.

Cannas are most effective when planted in masses, either alone or in combination with salvia (scarlet sage) and bordered with coleus or other dwarf-growing bedding plants. They are also frequently used with some of the tall-growing ornamental grasses, with which striking combinations can often be secured. They do best in sunny situations, and should be set out about 2 feet apart each way.

### **PEONIES**

If to be sent by mail, add postage at zone rates

Double Peonies are too well known to require description. Their present popularity is due to the great improvement in them in recent years, their easy culture, the handsome appearance of the plant, and the brilliant and striking effect of their massive, finely formed and richly colored flowers. The attention given to them in Europe and in America has resulted in the production of many notably fine new varieties. Among hardy, herbaceous perennials, the Chinese Peonies rank about first for lawn or flower-border, or shrubbery decoration.

Herbaceous Peony

Our assortment includes some of the best and most distinct sorts, new and old. There are many kinds, including varieties showing but trifling variations, which we omit.

### LILIES

If to be sent by mail, add postage at zone rates

Lilies are easily grown and require little care. They do best in a light, well-drained soil. Some peat or leaf-mold may be used to advantage. They also prefer partial shade, and the taller sorts must have protection from high winds.

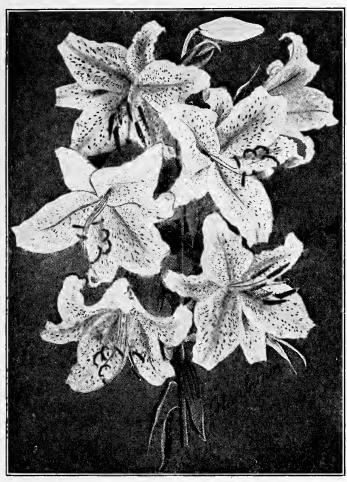

# White Trumpet Lily

This is among the most beautiful and valuable of garden Lilies. It grows from I to 4 feet high, and bears many trumpet-shaped, sweetly scented, waxy white flowers of great substance. A well-drained, light loam, enriched with leaf-mold, suits it best.

white flowers of great substance. light loam, enriched with leaf-me

Bag......\$3 50 | Ton, about.....\$30 00

Not less than one bag sold.

# Bowker's Ammoniated Food for Flowers

Excellent for use on house plants, being entirely odorless.

Small pkg......\$0 25 | Large pkg......\$0 50

### **Hardwood Ashes**

Highest grade unleached. For top-dressing lawns, especially if the soil is stiff or sour, 1½ to 2 tons to the acre.

### HIGH-GRADE FERTILIZERS, continued

### Clay's Celebrated Fertilizer

Prices in bags (subject to change)

One of the best manures for all horticultural purposes, either in greenhouse or garden. Splendid for mixing with potting soil and as a top-dressing. Notwithstanding its apparently high price, it is quite economical.

₹4cwt. (28 lbs.)\$4	50
½cwt. (56 lbs.) 8	00
Cwt. (112 lbs.)	00

### Thomson's Vine Manure

Unrivaled for vines, tomatoes, cucumbers, fruit trees and all foliage, flowering and fruit-bearing plants, also for vegetables and outdoor plants of every description. The result of many years' practical experience.

½cwt. (	56 lbs.)\$5	00
Cwt. (11	2 lbs.)	00

### Thomson's Special Chrysanthemum Manure

½cwt. (56 lbs.)	\$8 <b>oo</b>
-----------------	---------------

### Pulverized Sheep Manure Sheepshead Brand

A rich, pure, natural manure. Excellent as a top-dressing for lawns. Its effect is immediate and lasting. Apply at the rate of 1,500 pounds to the acre. It makes a rich and safe liquid manure—one pound to five gallons of water.

### Nitro-Fertile

The odorless liquid fertilizer for use on vegetableand flower-garden, lawns, shrubbery, etc., to force growth.

½pt Pt	.\$o 35	Qt	\$1	05
Pt	. 60	½gal	I	70
Gal				

One gallon is sufficient for one season for the average garden or lawn allowing for three or four applications.

### **Pulverized Limestone**

A product that has an exceedingly wide sale among intelligent agriculturists, with the best of results. As a crop-producer we hardly believe it has an equal. It is made from the purest crystalline white limestone obtainable, and analyzes about 97 per cent carbonate.

Bag of 100 ll	os\$1	50	½ton	\$11	00
Ton				. 20	00

# Lawn (Evergreen) Lime The Grass and Garden Tonic

Will cure the acidity of the soil, renovate old lawns, and is a sanitary and healthful fertilizer.

50-lb. bags......\$1 oo | 25-lb. bags......\$0 60

### Bone Fertilizers, Etc.

Prices subject to change

**Pure Ground Bone Meal No. 1.** Finely pulverized; excellent for rose-culture. It decomposes very rapidly, and is more quickly effective than the coarser grades. It is excellent for mixing with the soil for potting.

5 lbs\$0 50	100 lbs\$4 50
10 lbs 80	½ton20 00
25 lbs 1 30	½ton38 00
50 lbs 2 40	Ton74 00

**Ground Bone No. 2.** Coarser than the above; for top-dressing for lawns, and for garden and field crops.

	½ton\$41 50

IMPORTED SCOTCH SOOT	
NITRATE OF SODA	

FARMOGERM. See page 58. Price, garden size, 50 cts.; 1-acre bottle, \$2; 5-acre bottle, \$8.

MULFORD CULTURES. See page 58. Price, garden size, 25 cts.; 1/4-acre size, 50 cts.; 1-acre size bottle, \$1.50; 5-acre size bottle, \$5.

MULFORD CULTURES greatly increase the yield of Alfalfa, Clover, Cowpeas, Soy Beans, Vetches, and other Legumes and these crops add humus and nitrogen to the soil, thus increasing the crops of Wheat, Cotton, Corn, and the like. Why waste time and labor in producing half a crop when Mulford Cultures will double the yield? See page 58 for full information.

Spray Pump, Bucket

Being made of brass, it is not affected by the arsenites used for spraying. Easily operated; throws a solid stream 50 feet. It is provided with a combination nozzle, and also with a

SPRAY PUMP, BUCKET, continued

sprinkler for flowers. For spraying large trees, an 8-foot pipe extension is supplied for 90 cts. extra. This pump is also valuable for washing windows. \$4.75.

### **Syringes**

No. A. One spray rose and one jet. Length of barrel, 12 inches; diameter, 1 inch. \$2.75 each.

No. G. One spray rose and one stream jet, side attachment and elbow-joint for sprinkling under foliage. Length of barrel 16 inches; diameter, 11/2 inches. \$5.25 each.

No. H. Sheet brass with fixed spray rose; length of barrel 16 inches, diameter, 1½ inches. \$3.25 each.

No. 2. One coarse and one fine spray rose, and one jet, side attachment. \$4.75 each.

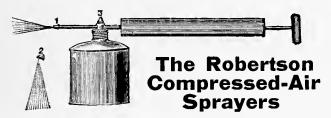

No. 3. Large size. Has one stream and two spray roses, with side pieces on barrel. Length of pieces on barrel. barrel, 18 inches; diameter, 1½ inches. \$7 each.

No. 6. Large size. Has one spray rose and gooseneck angle joint, turning in all directions for washing the under surface of the leaves of plants and flowers, cleansing them from insects, etc. Length of barrel, 18 inches; diameter, 11/2 inches. \$8.50 each.

TARRED FELT DISKS STER-LINGWORTH. For protecting cabbage and cauliflower plants, when first set out, against the root maggot; fits around the stems of the plants. 50 cts. per 100, \$2.50 per 1,000.

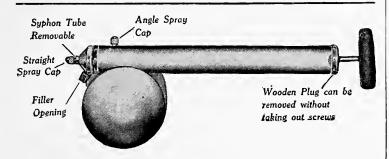

Postage, Express or Freight Charges to be paid by Purchaser. Prices not guaranteed, subject to change

### HORTICULTURAL IMPLEMENTS AND GARDEN REQUISITES, continued

Easily operated, requiring half the labor of ordinary sprayers.

Galvanized Tank.....\$1 25 Brass Tank..... 2 00

### **Auto Sprayer**

Operates continuously on both the up and down stroke, throwing a fine, misty spray.

### Vaporizing Spray Pump, Hand

A very useful Sprayer for a small garden. Simple and effective; no valves to get out of order. Made of tin. 50 cts. each.

Of large capacity and exceptionally powerful. It is easily operated by one person when necessary, but is especially built for spraying with two leads of hose. The airchamber is rather large, and enough air is stored up for a continuous spray for some time. Plunger, valves and all working parts are made of very good quality brass. It can be quickly inserted or removed from the barrel. Its paddle agi-

tator is far superior to the old return-discharge Adjustable to different-sized method of stirring.

barrels. Pump only, with agitator, \$23.50.

Outfit C. Pump, Agitator, 15 feet of Discharge
Hose and Spray Nozzle, \$30; fitted to Barrel, \$35. Outfit D. Pump, Agitator, two leads of Discharge Hose and two Spray Nozzles, \$34.50; fitted to Barrel, \$40.50.

### "Fruitall" Spray Pump

Same as Pomona, but smaller. Pump with Agitator and one lead of 15 feet of 3/8-in. Discharge Hose, with Spray Nozzle, \$20; fitted to Barrel, \$25.

Prices subject to change

### Knapsack Spray Pump

FOR VINEYARD, ORCHARD AND FIELD SERVICE TO BE CARRIED ON BACK

Made entirely of brass and copper, with ball valves and metal plunger all easily accessible. Capacity about 5 gallons.

Galvanized, \$23; Copper, \$28.

### Compressed-Air Spray Pump

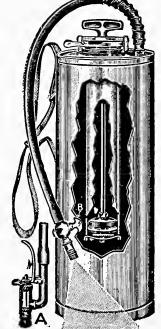

A self-operating Sprayer of simple construction, durable, easy to carry and to work. Made of galvanized iron or solid brass, with 4-ply rubber hose. For spraying trees, cleaning windows, etc. A perfect pump.

With Brass Tank, Auto-Pop Nozzle, Hose and Fittings, \$11.

With Galvanized Iron Tank, Auto-Pop Nozzle, Hose and Fittings, \$8.

Brass Extension Pipes, 2

feet long, 70 cts. Auto-Pop Nozzle, if sold alone, \$2.

### **Bottle Sprayer**

A small, nickel-plated syringe or sprayer, to be placed in a bottle; used for spraying with any kind of fumigating liquid or insecticide, \$1.35.

### Water-Barrel, Truck and Barrel

CAN BE MADE INTO SPRINKLER, LEAF-RACK AND HAND-CART

The barrel is easily disconnected from the truck, either while full or empty. The following extra attachments can be furnished if required: (1) Box with trunnions and spring catch, forming a dump-(2) Sprinkler for watering walks ing hand-cart. and lawns. (3) Leaf-rack.

Prices on application

# The Thorburn Century Ball-Bearing Lawn Mower

Thorburn's Century Ball-Bearing Lawn

**Mower** is a marvel of simplicity, as one screw adjusts both bearings. It has a simple, self-adjusting device, which keeps the bearings properly adjusted for a long time, and a double interchangeable ratchet. By shifting handle bails from the front to the rear lugs on the side frame, the Mower can be made to cut terraces and steep banks.

While cheaper Mowers are sold everywhere, they will be found far dearer in the end. It pays to get a good Mower.

	Net Prices	Each

The Best for Putting-Greens

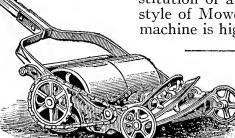

4 blades

### Chain Roller or Golf Mower

This Mower is made to meet the demand for a machine that will more perfectly cut borders, verges, etc., and yet retain all the other features necessary in a Mower for general work. Its great advantage is the substitution of a bicycle chain for the gears generally used in this style of Mower. This reduces the friction to a minimum. The machine is highly recommended for work on putting-greens.

### **Grass-Catcher**

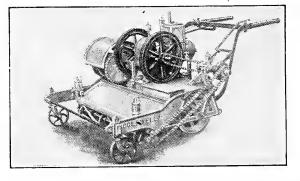

12-in. cut\$2	00	18-in. cut\$2	75
14-in. cut 2	25	20-in. cut 3	00
16-in. cut 2	50		

### Improved Horse Lawn Mower

This well-known standard Mower has side-draft attachment, to enable the horse to walk on the cut grass only, and caster-rollers which will not mark the lawn. Evenness of cut is assured by an adjustment which raises or lowers the two sides at the same time by means of a simple lever movement; the same lever serves the purpose of raising the knives from the ground when driving over gravel walks or roads.

### Net Prices, free on board, New York

	40-in. cut, complete, 4 blades 136 00

# Coldwell's Combination Roller and Motor Lawn Mower

This machine cuts a swath 30 and 35 inches wide, is equipped with a two-horse power motor capable of propelling the mower through almost any height of lawn grass, and up steep grades. Price on application.

### The "Velvetlawn" Grass Seeder

18 inches wide

The use of a machine in the seeding of new lawns or grass plots, the re-seeding of old lawns, the drilling of grass seeds into putting-greens, and the renewing of grass plots every month or so has proved a decided success wherever it has been tried. The machine to do this work is the "Velvetlawn" Grass Seeder. Price \$25 net cash, subject to change.

### HORTICULTURAL IMPLEMENTS AND GARDEN REQUISITES, continued

### Horse Boots

Prevent cutting up of the turf

Made to order only of very strong, heavy leather, closely riveted. Present price per set of four, \$14; subject to change.

### Water-Ballast Roller

Roller-Bearing. Can be filled without turning on end, with either water or sand. (Patented) Suitable for Lawns, Tennis-Courts and Putting-Greens; seams are electric welded, not riveted

One- or two-section "Water Weight" Rollers without counter-balancing handle-weights.

We are publishing handy leaflets upon the culture of all kinds of vegetables, which we will be pleased to mail to any of our customers indicating the particular variety, or varieties, they are interested in. Any additional advice will be gladly given our customers who will write us of their needs in regard to the care of their gardens.

### ORDER SHEET FOR SEEDS, ETC.

Ship via	(State here if wanted by Express, Freight or Mail)	
AMOUNT ENCLOS	SED, \$Date	1920

J. M. Thorburn & Co. give no warranty, express or implied, as to description, quality, productiveness, or any other matter of any seeds, bulbs, or plants they send out, and will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms, they are at once to be returned.

It will be well to state, when ordering, whether we are at liberty to substitute or not. Customers can depend upon our using our best judgment in substituting other equally good sorts for those ordered which we may not be able to supply, as, owing to transportation difficulties, some varieties may be late in reaching us.
